

FRASER VALLEY REGIONAL DISTRICT

REGIONAL AND CORPORATE SERVICES COMMITTEE

OPEN MEETING AGENDA

Tuesday, December 8, 2020 10:00 am Zoom Conference Call

Pages

1. CALL TO ORDER

MOTION FOR CONSIDERATION

THAT due to the Provincial Health Order issued on November 19, that the Fraser Valley Regional District conduct meetings without the members of the public present in the Boardroom;

AND THAT the Fraser Valley Regional District continue to promote openness, transparency, accessibility and accountability by webcasting and archiving Board meetings online, allowing members of the public to write, email, call in or appear by Zoom with questions, and promoting public participation at meetings through social media channels.

2. APPROVAL OF AGENDA, ADDENDA AND LATE ITEMS

MOTION FOR CONSIDERATION

THAT the Agenda, Addenda and Late Items for the Regional and Corporate Services Committee Open Meeting of December 8, 2020 be approved;

AND THAT all delegations, reports, correspondence and other information set to the Agenda be received for information.

3. MINUTES/MATTERS ARISING

3.1. Draft Regional and Corporate Services Committee Meeting Minutes -November 10, 2020

5 - 10

MOTION FOR CONSIDERATION

THAT the Minutes of the Regional and Corporate Services Committee Open Meeting held November 10, 2020 be adopted.

4. LEGISLATIVE SERVICES

4.1. 2021 FVRD Board & Committee Meeting Schedule

- Corporate report dated December 8, 2020 from Jaime Reilly, Director of Legislative Services
- 2021 Board and Committee Meeting Schedule

MOTION FOR CONSIDERATION

THAT the Fraser Valley Regional District Board adopt the proposed 2021 FVRD Board & Committee meeting schedule.

4.2. FVRD Animal Control Sub- Regional Regulations Amendment Bylaw No. 1617, 14 - 17 2020

- Corporate report dated December 8, 2020 from Trina Douglas, Manager of Contracted Services
- Draft Fraser Valley Regional District Sub-Regional Animal Control Regulations Amendment Bylaw No. 1617, 2020

MOTION FOR CONSIDERATION

THAT the Fraser Valley Regional District Board consider giving three readings and adoption to the bylaw cited as *Fraser Valley Regional District Sub-Regional Animal Control Regulations Amendment Bylaw No. 1617, 2020.*

5. FINANCE

5.1. 2021 Regional Grant-in-Aid Policy

- Corporate report dated December 8, 2020 from Kelly Lownsbrough, Director of Finance
- Regional Grant-in-aid Policy
- Regional Grant-in-aid Application Form
- Regional Grant-in-aid Policy dated October 26, 1999

MOTION FOR CONSIDERATION

THAT the Fraser Valley Regional District Board approve the attached Regional Grant-in-Aid Policy, effective January 1, 2021 and repeal the Grant-in-Aid Policy dated October 26, 1999.

5.2. 2020 – 2024 Financial Plan Amendment

• Corporate report dated December 8, 2020 from Kelly Lownsbrough, Director of Finance

MOTION FOR CONSIDERATION

THAT the Fraser Valley Regional District Board direct staff to prepare for the Board's consideration an amendment to the Fraser Valley Regional District 2020 – 2024 Financial Plan Bylaw No. 1585, 2020 to include expenditures

25 - 26

18 - 24

related to Mosquito Control.

6. REGIONAL SERVICES

6.1. ENVIRONMENTAL SERVICES

6.1.1.	Nuisance Mosquito Control Program 2020 Year End Report 27 -	
	FOR INFORMATION ONLY	
	 Corporate report dated December 8, 2020 from Lance Lilley, Manager of Environmental Services 	
	2020 FVRD Year-End Mosquito Control Report	
6.1.2.	Air Quality Service Agreement with Metro Vancouver	100 - 102
	 Corporate report dated December 8, 2020 from Marina Richter, Environmental Policy Analyst 	
	MOTION FOR CONSIDERATION	
	THAT the Fraser Valley Regional District Board authorize its	

signatories to execute an Air Quality Monitoring Agreement with Metro Vancouver to not exceed the maximum cost of \$228,600 per year, plus the rate of inflation, for 2021-2030.

6.2. STRATEGIC PLANNING AND INITIATIVES

•

6.2.1. Three-Year Transit Expansion Initiatives Letter – FVX Expansion 103 - 109

- Corporate report dated December 8, 2020 from Alison Stewart, Manager of Strategic Planning
- Letter from BC Transit re Three Year Expansion Initiatives

MOTION FOR CONSIDERATION

THAT the Fraser Valley Regional District Board confirm its continued support for the previously approved 2021/2022 expansion initiative to extend the Fraser Valley Express service to TransLink's Lougheed Town Centre Sky Train subject to discussion with municipal partners;

AND THAT BC Transit and the FVRD reaffirm its request to undertake more detailed costing analysis and consultation relating to potential expansion of transit service on the north side of the Fraser River between the District of Kent and District of Mission.

AND FURTHER THAT BC Transit reassess the existing Cultus Lake service to ensure it is meeting the community's current needs and expectations.

7. ADDENDA ITEMS/LATE ITEMS

8. REPORTS BY STAFF

9. REPORTS BY DIRECTORS

10. PUBLIC QUESTION PERIOD FOR ITEMS RELEVANT TO AGENDA

Email submissions can be made to info@fvrd.ca before 1 pm, December 7. Alternatively, you may participate in public question period live on Zoom, by phone or computer using the Zoom information provided on the FVRD website.

11. RESOLUTION TO CLOSE MEETING

MOTION FOR CONSIDERATION

THAT the meeting be closed to the public, except for Senior Staff and the Executive Assistant, for the purpose of receiving and adopting Closed Meeting Minutes convened in accordance with Section 90 of the *Community Charter* and to consider matters pursuant to:

• Section 90(1)(a) of the *Community Charter* - personal information about an identifiable individual who holds or is being considered for a position as an officer, employee or agent of the municipality or another position appointed by the municipality.

RECESS

- 12. RECONVENE OPEN MEETING
- 13. RISE AND REPORT OUT OF CLOSED MEETING
- 14. ADJOURNMENT

MOTION FOR CONSIDERATION

THAT the Regional and Corporate Services Committee Open Meeting of December 8, 2020 be adjourned.

FRASER VALLEY REGIONAL DISTRICT REGIONAL AND CORPORATE SERVICES COMMITTEE OPEN MEETING MINUTES

Tuesday, November 10, 2020 10:00 am FVRD Boardroom, 45950 Cheam Avenue, Chilliwack, BC

Members Present:	Director Jason Lum, City of Chilliwack, Chair (via Zoom conference call) Director Patricia Ross, City of Abbotsford, Vice Chair (via Zoom conference call) Director Sandy Blue, City of Abbotsford (via Zoom conference call) Director Bill Dickey, Electoral Area D (via Zoom conference call) Director Carol Hamilton, District of Mission (via Zoom conference call) Director Orion Engar, Electoral Area E (via Zoom conference call) Alternate Director Michie Vidal, Village of Harrison Hot Springs (via Zoom conference call) Director Sylvia Pranger, District of Kent (via Zoom conference call) Director Terry Raymond, Electoral Area A (via Zoom conference call) Director Peter Robb, District of Hope (via Zoom conference call) Director, Al Stobbart, Electoral Area G (via Zoom conference call)
Regrets:	Director Leo Facio, Village of Harrison Hot Springs Director Pam Alexis, District of Mission
Staff Present:	 Jennifer Kinneman, Chief Administrative Officer (via Zoom conference call) Kelly Lownsbrough, Director of Finance /Chief Financial Officer (via Zoom conference call) Jaime Reilly, Director of Legislative Services/Corporate Officer (via Zoom conference call) Stacey Barker, Director of Regional Services (via Zoom conference call) Suzanne Gresham, Director of Community Initiatives & Strategic Engagement (via Zoom conference call) Christina Vugteveen, Manager of Parks and Recreation (via Zoom conference call) David Urban, Manager of Outdoor Recreation Planning (via Zoom conference call)

Lance Lilley, Manager of Environmental Services (via Zoom conference call) Trina Douglas, Manager of Contract Services (via Zoom conference call) Jamie Benton, Environmental Policy Analyst (via Zoom conference call) Hafsa Salihue, Environmental Services Technician (via Zoom conference call) Tyler Davis, Fire Dispatch Management Communications Coordinator Kristen Kohuch, Executive Assistant to CAO and Board (*Recording Secretary*)

1. CALL TO ORDER

Chair Lum called the meeting to order at 10:00 am.

Discussion ensued and the following motion was introduced:

Moved By DICKEY Seconded By ROSS

THAT due to the Provincial Health Order issued on Saturday, November 7, that the Fraser Valley Regional District conduct meetings without the members of the public present in the Boardroom;

AND THAT the Fraser Valley Regional District continue to promote openness, transparency, accessibility and accountability by webcasting and archiving Board meetings online, allowing members of the public to write, email, call in or appear by Zoom with questions, and promoting public participation at meetings through social media channels.

CARRIED

2. APPROVAL OF AGENDA, ADDENDA AND LATE ITEMS

Moved By RAYMOND Seconded By STOBBART

THAT the Agenda, Addenda and Late Items for the Regional and Corporate Services Committee Open Meeting of November 10, 2020 be approved;

AND THAT all delegations, reports, correspondence and other information set to the Agenda be received for information.

CARRIED

3. MINUTES/MATTERS ARISING

3.1 <u>Draft Regional and Corporate Services Committee Meeting Minutes -</u> October 15, 2020

Moved By ROSS Seconded By HAMILTON

THAT the Minutes of the Regional and Corporate Services Committee Open Meeting of October 15, 2020 be adopted.

CARRIED

Page 3

4. FINANCE

4.1 Financial Plan 2020 – 2024 Amendments

Moved By DICKEY Seconded By PRANGER

THAT the Fraser Valley Regional District Board direct staff to prepare for the Board's consideration an amendment to the Fraser Valley Regional District 2020 – 2024 Financial Plan Bylaw No. 1585, 2020 to include expenditures and funding for the Popkum Sewer System remediation and the Popkum Sewer System SCADA integration.

CARRIED

5. **REGIONAL SERVICES**

5.1 ENVIRONMENTAL SERVICES

5.1.1 Update on Source Separation Bylaw

Comments were offered about the uncertainty created by COVID-19 as it impacts outreach efforts with respect to the Source Separation Bylaw public education campaign.

The Committee asked if private haulers were following the new bylaw regulations. Staff commented that haulers have indicated they are working on rolling out services. There has been confusion among the public regarding split trucks with recycling and garbage compartments; staff are promoting better public education by haulers regarding this matter.

Moved By ROSS Seconded By ROBB

THAT the Fraser Valley Regional District direct staff to continue to provide information about the *Fraser Valley Regional District Solid Waste Removal Bylaw No.* 1495 (2018), but to postpone a wide-spread public education campaign until mid-2021 or later, depending on the state of the COVID-19 pandemic.

CARRIED

5.2 REGIONAL PARKS

5.2.1 Regional and Community Parks and Trails Summer Usage - 2020

The corporate report dated November 10, 2020 from Gord Gadsden, Park Technician II was provided for information.

The Committee provided positive comments regarding increased usage on hiking trails, and asked if this study distinguished how many parks and trail users are from inside and outside of the Regional District. Staff commented that this study did not focus on that type of data however, the 2019 Outdoor Economic Impact analysis provides such detailed information and revealed that 40% of people participating in outdoor recreation activities in the FVRD are from outside the Fraser Valley.

5.2.2 <u>Modification of the Glen Valley and Matsqui Trail Regional Parks</u> <u>Operating & Maintenance Agreement with the City of Abbotsford</u>

Moved By STOBBART Seconded By BLUE

THAT the Fraser Valley Regional District Board grant a modification until December 31, 2020, to the Glen Valley Regional Park and Matsqui Trail Regional Park Operating and Maintenance Agreement with the City of Abbotsford for the budgeted annual amount of \$527,900.

CARRIED

5.3 OUTDOOR RECREATION AND PLANNING

5.3.1 2021 Job Creation Partnership Program Grant Application

The Committee commented on challenges of attracting and retaining program participants.

Moved By PRANGER Seconded By POPOVE

THAT the Fraser Valley Regional District Board direct staff to submit a grant application in 2021 to the Job Creation Partnership program for infrastructure improvements to FVRD regional parks and in support of Experience the Fraser.

CARRIED

6. ADDENDA ITEMS/LATE ITEMS

None.

7. REPORTS BY STAFF

None.

8. **REPORTS BY DIRECTORS**

<u>Director Engar</u> commented on the record-breaking housing sales in the region as well as many job losses due to COVID-19.

<u>Director Lum</u> commented on the recent Provincial election and introduced the following motion:

Moved By ROSS Seconded By PRANGER

THAT the Fraser Valley Regional District Board support sending letters of congratulations to new MLA's in the region and thank you letters to those exiting the role for their years of service.

9. PUBLIC QUESTION PERIOD FOR ITEMS RELEVANT TO AGENDA

There were no written questions submitted with respect to items on the agenda. Staff commented that members of the public were provided the opportunity to join the Zoom call by computer or over the phone and ask questions to the Committee. It was noted that no questions were received in-person or online.

10. RESOLUTION TO CLOSE MEETING

Moved By ROBB Seconded By DICKEY

THAT the meeting be closed to the public, except for Senior Staff and the Executive Assistant, for the purpose of receiving and adopting Closed Meeting Minutes convened in accordance with Section 90 of the *Community Charter* and to consider matters pursuant to:

- Section 90(1)(c) of the Community Charter labour relations or other employee relations and,
- Section 90(2)(b) of the Community Charter the consideration of information received and held in confidence relating to negotiations between the municipality and a provincial government or the federal government or both, or between a provincial government or the federal government or both and a third party.

CARRIED

The meeting recessed at 10:16 am.

11. RECONVENE OPEN MEETING

The meeting reconvened at 10:34 am.

12. RISE AND REPORT OUT OF CLOSED MEETING

None.

13. ADJOURNMENT

Moved By RAYMOND Seconded By STOBBART

THAT the Regional and Corporate Services Committee Open Meeting of November 10, 2020 be adjourned.

CARRIED

The Regional and Corporate Services Committee Open Meeting of November 10, 2020 adjourned at 10:34 am.

MINUTES CERTIFIED CORRECT:

Director Jason Lum, Chair

CORPORATE REPORT

To: Regional and Corporate Services Committee From: Jaime Reilly, Director of Legislative Services Date: 2020-12-08 File No: 0550-01-01

Subject: 2021 FVRD Board & Committee Meeting Schedule

RECOMMENDATION

THAT the Fraser Valley Regional District Board adopt the proposed 2021 FVRD Board & Committee meeting schedule.

STRATEGIC AREA(S) OF FOCUS

Provide Responsive & Effective Public Services

BACKGROUND

At the November 24, 2020 Board meeting, the FVRD Board gave three readings to the Fraser Valley Regional District Board and Committee Procedures Bylaw No. 1600, 2020. The new FVRD procedure bylaw sets the meetings of the Regional and Corporate Services Committee for 10am on the second Thursday of each month.

At the December meeting of each year, the FVRD Board is provided with a proposed Board and Committee Meeting Schedule for the following year's meetings.

DISCUSSION

In creating the attached proposed schedule, staff review the council meeting schedules for all six Member Municipalities, as well as any BC statutory holidays to ensure that there are no conflicts. Dates for annual conferences such as the Regional District CEO/CAO Forum and Municipal Finance Authority (March 2021), the Lower Mainland Local Government Management Association (May 12 to 14, 2021), Federation of Canadian Municipalities (June 3 to 6, 2021), and the Union of British Columbia Municipalities (September 13 to 17, 2021) are also reviewed to ensure there are no conflicts with the proposed meeting dates.

COST

There are no costs associated with this recommendation.

CONCLUSION

After reviewing municipal council meeting schedules, as well as all BC statutory holidays, the proposed 2021 FVRD Board & Committee Meeting Schedule is being brought forward for the Board's consideration.

CORPORATE REPORT

To: Regional and Corporate Services Committee From: Trina Douglas, Manager of Contracted Services Date: 2020-12-08 File No: 3920-30

Subject: FVRD Animal Control Sub- Regional Regulations Amendment Bylaw No. 1617, 2020

RECOMMENDATION

THAT the Fraser Valley Regional District Board consider giving three readings and adoption to the bylaw cited as *Fraser Valley Regional District Sub-Regional Animal Control Regulations Amendment Bylaw No.* 1617, 2020.

STRATEGIC AREA(S) OF FOCUS

Provide Responsive & Effective Public Services

BACKGROUND

The Fraser Valley Regional District (FVRD) Animal Control Regulation Bylaw No. 1206, 2013, and its amendments, outlines the regulatory requirements for the control and care of dogs within the City of Abbotsford, the City of Chilliwack, the District of Kent, the Village of Harrison Hot Springs, and the District of Mission. An essential component of the animal control program is dog licensing. Licenced dogs require significantly less handling and lodging and helps staff return dogs to their owners quickly. At-large or lost dogs that are wearing a current licence are offered one free ride home per calendar year.

In April 2020, the FVRD Board adopted the *Fraser Valley Regional District Sub-Regional Animal Control Amendment Bylaw No.* 1593, 2020. This amendment included a temporary provision to remove the 25% late fee for those that did not obtain an annual dog licence by the due date. The purpose of this temporary measure was to provide financial relief to dog owners as a result of COVID-19.

DISCUSSION

Within the FVRD, dog licence fees are payable by January 1st of each year for the year ahead. Dog owners who pay their licence fees prior to the deadline or those who obtain a dog after the deadline do not incur late fees. For others, late fees are applied to act as an incentive to pay on time and to help cover the additional administrative costs associated with sending reminder notices and follow-ups.

For 2021 renewals, current dog owners were sent renewal notices during the first week of November, 2020. For dog licence fees that are left outstanding after the deadline, reminder notices will be mailed

out in the first quarter of 2021. With penalty fees applied in Chilliwack, for example, where an annual dog licence costs \$20, the penalty fee would represent an additional \$5.00.

For licence accounts that remain outstanding after the reminder notices are sent, staff provide additional follow up through telephone, in person, or by email advising dog owners that they will receive additional fines if they do not licence their dog. For dog owners that are still in contravention of the licencing requirements, fines are issued.

To impose a fee or charge payable for a regional district service, the *Local Government Act* requires that the fee or charge must be established and amended by bylaw. Staff are recommending that the draft bylaw (attached) be adopted to re-apply the 25% late penalty fee which was removed early in 2020 to serve as financial relief during the initial wave of COVID-19.

COST

The FVRD's sub-regional animal control service relies on dog licence fees as part of its revenue stream. The 2021 budget includes \$615,000 in total licencing fees. 2020 licence revenue at the time of writing this memo is down approximately \$30,000 when compared to 2019 revenues. This reduction in revenue was expected in response to the removal of the late penalty.

CONCLUSION

COVID 19 is still active in our communities; however, dog owners who comply with licencing by the deadline would not be impacted by penalty fees. Penalty fees would only apply to dog owners who do not comply with licencing when required.

FRASER VALLEY REGIONAL DISTRICT

BYLAW NO. 1617, 2020

A bylaw to amend the regulations established by Animal Control Regulation Bylaw No. 1206, 2013 for the Sub-Regional Animal Control Service Area

WHEREAS the Board of Directors of the Fraser Valley Regional District ("the Board") has deemed it advisable to amend *Fraser Valley Regional District Animal Control Regulation Bylaw No. 1206, 2013,* as amended.

THEREFORE the Board enacts as follows:

1) <u>CITATION</u>

This bylaw may be cited as the Fraser Valley Regional District Sub-Regional Animal Control Regulations Amendment Bylaw No. 1617, 2020.

2) <u>ENACTMENTS</u>

That Fraser Valley Regional District Bylaw No. 1206, 2013 be amended by:

1. Deleting Section 10 in its entirety and replacing it with the following:

"**10**. Where an owner makes application for a dog licence, the owner must pay the licence fee set out in the applicable Schedule A-I or A-II to this bylaw.

- a) A person who becomes liable to pay the licensce fee before January 1st and does not pay the fee before January 1st shall, notwithstanding the provisions of Sections 10 to 13 inclusive, pay a late penalty of an additional 25%.
- b) If an owner acquires a dog after July 1st of the current licence year, the applicable licence fee will be reduced by 50% to a minimum of \$10. This reduction does not apply to aggressive or nuisance dogs."
- 2. Inserting footnotes to the "Fee" column headers in Schedules A-I and A-II To read "Subject to penalties as described in Section 10 a) of this bylaw"

3) <u>SEVERABILITY</u>

If a portion of this bylaw is found invalid by a court, it will be severed and the remainder of the bylaw will remain in effect.

CORPORATE REPORT

To: Regional and Corporate Services Committee From: Kelly Lownsbrough, Director of Finance

Subject: 2021 Regional Grant-in-Aid Policy

Date: 2020-12-08 File No: 0340-30-27229

RECOMMENDATION

THAT the Fraser Valley Regional District Board approve the attached Regional Grant-in-Aid Policy, effective January 1, 2021 and repeal the Grant-in-Aid Policy dated October 26, 1999.

STRATEGIC AREA(S) OF FOCUS Support Healthy & Sustainable Community

BACKGROUND

The Fraser Valley Regional District administers two Grant-in-Aid ("GIA") programs. Electoral Area GIAs are administered through the Electoral Area GIA Guidelines and Application, dated January 1, 2012, amended October 27, 2015.

For Regional GIAs, while there is a somewhat out-of-date Grant-in-Aid Policy (attached and dated October 26, 1999), the Regional GIAs have historically been incorporated into the Regional Budget Requisitions directly naming the organizations which received support; Wildsafe BC and Elizabeth's Wildlife Center. This report seeks to replace the dated Grant-in-Aid Policy with a Regional GIA Policy.

The Regional GIA Policy is drafted under the authority of the Local Government Act, Section 263(1)(c) which designates the corporate powers of a Regional District Board the ability to provide assistance for the purpose of benefiting the community, or any aspect of the community. For the purposes of this Policy, community is deemed to represent the Regional District.

DISCUSSION

The FVRD has a Regional Grant-in-Aid Policy that is seldom referenced and outdated. This report seeks to update and replace the Regional Grant-in-Aid Policy with a more robust policy, effective January 2021. The purpose of the Regional GIA is to provide a framework whereby financial assistance can be provided to non-profit organizations or community groups who provide services or a benefit to the

Regional District, whether those services span the entire Regional District or the majority of the Regional District.

This updated Regional GIA Policy includes two changes that are proposed to be effective for the 2022 Financial Plan.

- Incorporation of the two long-standing Regional Grants-in-Aid (Wildsafe BC \$15,000 per annum and Elizabeth's Wildlife Center \$5,000 per annum) into the Environmental Services and Animal Control budgets, respectively.
- 2. Launch of an annual Regional GIA application process that includes a set deadline for applications (August 31) that ties into the annual budget process, as well as an annual maximum of \$50,000 (for all Regional GIA). Should the maximum Regional GIA be reached, the impact per residential property is approximately \$0.50 for every residential property in the FVRD.

This Policy is proposed to be effective January 1, 2021, to enable advance communication of the application process and timelines for the 2022 Financial Plan. For Regional GIA funding in 2021, the proposed Financial Plan includes GIA, per past practice, for Wildsafe BC \$15,000 and Elizabeth's Wildlife \$5,000.

COST

There are no direct costs with this report. The Policy does commit to two items for the 2022 Financial Plan and grant certainty for Wildsafe BC \$15,000 and Elizabeth's Wildlife \$5,000.

CONCLUSION

The proposed Regional Grant-in-Aid Policy is recommended for approval and to replace the existing Grant-in-Aid policy dated October 26, 1999.

COMMENTS BY:

Jennifer Kinneman, Chief Administrative Officer: Reviewed and supported. Historically, the FVRD has not had a regular budget line-item for regional grants-in-aid. Grants were budgeted ad hoc, on request. Examples of other past regional grants in aid included \$10,000 to the Cultus Lake Park Board for Milfoil removal (2006), \$50,000 to Canuck Place (2012), and \$50,000 to the Abbotsford Hospice (2014). Allocating \$50,000 per year to the budget would not require the Board to award grants annually, or provide the full allotment each year. Rather, this policy update and budget recommendation provides a clear and transparent process for future grant considerations.

FRASER VALLEY REGIONAL DISTRICT POLICIES AND PROCEDURES

POLICY:	Regional Grant in Aid Guidelines and Application	
Date Issued:	January 1, 2021	Date Amended: November 9, 2020

Purpose

To provide a framework whereby financial assistance can be provided to non-profit organizations or community groups who provide services or a benefit to the Regional District, whether those services span the entire Regional District or the majority of the Regional District.

Application

This policy shall apply to all regional area grant-in-aid requests being considered for funding. This policy does not provide any guidelines for Electoral Area Grants-In-Aid, those guidelines are set out in the Fraser Valley Electoral Area Grant-In-Aid Policies and Procedures dated October 27, 2015.

<u>Authority</u>

Local Government Act Section 263(1)(c): the corporate powers of a Regional District Board allow for the provision of assistance for the purpose of benefiting the community, or any aspect of the community.

For the purposes of this Policy, community is deemed to represent Regional District.

Eligibility Criteria

Who Can Apply:

- a. The applicant must be a registered non-profit organization or community group;
- b. The registered non-profit organization or community group must be locally based within the regional district or must otherwise provide services or benefits to the regional district. The Grant-In-Aid requested must provide a specific service or benefit to the regional district, or any aspect of the regional district; and
- c. The registered non-profit organization or community group must be financially and administratively sound.

Application Restrictions:

- a. Industrial, commercial, and/or business organizations are not eligible to apply.
- b. Grant-In-Aid may not be used to subsidize activities that are the responsibilities of other levels of government;
- c. Grant-In-Aid may not cover any of the following expenses:
 - i) Remuneration including wages and consulting fees;
 - ii) capital improvements to rented or leased premises;
 - iii) operating or capital deficits;
 - iv) tax payments; and/or
 - v) private enterprise.
- d. Grant-In-Aid cannot be used for political purposes or to fund groups or organizations whose primary purpose is of a political nature.

Application Process

- 1. All qualifying organizations and individuals are required to complete the Grant-In-Aid application form. Applications should include a summary of how the Grant-In-Aid will be used, if granted. It should be noted that organizations may be required to make a presentation or provide further documentation to the Fraser Valley Regional District Board before any decisions are made.
- 2. Incomplete applications will not be accepted and will be returned to the applicant.
- 3. All applicants will receive notification on the status of their application once reviewed by the Fraser Valley Regional District Board.
- 4. The Fraser Valley Regional District Board reserves the right to request a full accounting of any and all expenditures of authorized Grant-In-Aid funds.
- 5. Application deadline will be August 31 of each year, for consideration and inclusion in the following year's Financial Plan.
- 6. The Fraser Valley Regional District will set an annual amount up to \$50,000 per year, for the total of all applications.

Financial Accountability & Reporting

- 1. The Fraser Valley Regional District should be recognized as a funding agency through signage, event literature and/or program websites. This needs to be done in coordination with FVRD Manager of Communications.
- 2. Grants over \$1,000 require follow up with the Fraser Valley Regional District upon completion of the capital project or event, by December 31st of the year funds received. Follow up to include a letter to FVRD regarding usage of funds and their success, including pictures of the project/event and any other supporting information.
- 3. Grants over \$4,000 require submission of financial statements/reports for the applicant to be included with the funding application.
- 4. Funds remaining unspent after 12 months must be returned to the Fraser Valley Regional District.

Approval Criteria

The following criteria will be used in evaluating and prioritizing the applications for assistance under Section 263 (1)(c) of the *Local Government Act:*

- a. Confirmation that the applicant is eligible to apply for grant funds pursuant to this Grant-In-Aid Policy;
- b. Purpose for which funding is requested;
- c. Overall benefit to the regional district as a whole, or any aspect of the regional district;
- d. Amount of the grant requested;
- e. Whether or not there is an opportunity for individuals to make direct contributions; and
- f. Whether or not there is available funding for the grant requested.

Title

FRASER VALLEY REGIONAL DISTRICT POLICY AND PROCEDURES

SUBJECT: Grant-in-Aid	
EFFECTIVE DATE: October 26, 1999	REVISION DATE:

Purpose:

To allow for a grant-in-aid on behalf of the entire Regional District.

Eligibility:

To be eligible for a grant-in-aid on behalf of the entire Regional District, the party must be a community group or organization whose focus or purpose is in the arts, cultural, recreational, or social services, but only if:

- not commercial in nature;
- it is incorporated, either under the Societies Act of BC or under any federal act as a charitable organization;
- if the request for funding is under \$500, it may be an unincorporated group with a written constitution which outlines the objectives of the group as being charitable in nature;
- there is demonstrable financial need;
- funding would benefit the residents of the Regional District; and
- an organization which <u>has an application for a grant-in-aid under consideration by a</u> <u>member municipality</u>, or which has been approved for grant-in-aid funding from a member <u>municipality</u> will be ineligible for funding from the Regional District. This does not apply to a grant-in-aid that may be considered for funding in an electoral area/areas only.

Grant Criteria:

- The organization will have a large number of volunteers and able to demonstrate a broad base of community support.
- The activity or program is accessible to a large portion of the Regional District communities' residents.
- The activity or program is consistent with the objectives and standards of the community as represented to and supported by the Regional District Board.
- No contribution will be made toward travel expenses for individuals or teams to sporting events as this will not be considered as a regional grant-in-aid. Said individuals or teams may make representation to member municipalities or electoral areas where applicable.

• Non-profit societies operating at regional, provincial, or federal levels and conducting fundraising by means of tag days, mail outs, door-to-door campaigns, or telethons will not be eligible for grants-in-aid from the Regional District.

2

- Organizations which receive a fee-for-service from the Regional District are not eligible for grant-in-aid funding under this regional policy, unless the application is for a program other than the fee-for-service program.
- Preference will be given to applications with at least 50% of required funding coming from sources other than the Regional District.
- Applicants will provide as much detailed information as is possible on their organization including financial statements and annual operating budgets for the immediate year and future year.

Procedure:

All completed grant applications for funding from any regional grant-in-aid will be forwarded to the Executive Committee prior to December 31 for review. The Executive Committee will review each application and make recommendations to the Board as to whether grants should be approved, and the amount, subject to fund availability in the annual budget.

Payment:

- No approved grant will be paid until the adoption of the annual budget.
- The term for the grant shall be for one year only. Applicants are to be advised that the grant-in-aid will not be continued in subsequent years without further application. Renewals are not automatic nor is any increase in funds.
- No grant will be made to pay for past deficits incurred by non-profit societies.
- All applicants must submit a statement on the use of the funds at the end of the event/ project or the end of the calendar year, whichever occurs first. Failure to provide such an evaluation will result in any future grant request being rejected.

To: Regional and Corporate Services Committee From: Kelly Lownsbrough, Director of Finance / CFO Date: 2020-11-27

Subject: 2020 – 2024 Financial Plan Amendment

RECOMMENDATION

THAT the Fraser Valley Regional District Board direct staff to prepare for the Board's consideration an amendment to the Fraser Valley Regional District 2020 – 2024 Financial Plan Bylaw No. 1585, 2020 to include expenditures related to Mosquito Control.

STRATEGIC AREA(S) OF FOCUS

Support Healthy & Sustainable Community Provide Responsive & Effective Public Services

BACKGROUND

Fraser Valley Regional District 2020 – 2024 Financial Plan Bylaw No. 1585, 2020 ("Financial Plan") was adopted by the Board on February 25, 2020. In October, three amendments were proposed to the Board and in November, two additional amendments were proposed. A further amendment to this bylaw is required as a result of circumstances arising during 2020.

DISCUSSION

Following adoption of the Five-Year Financial Plan in February, circumstances arose during the year, which require updates to the Plan. Section 374 (2) of the Local Government Act states that the Financial Plan may be amended by bylaw at any time. The following amendment to the current Five-Year Plan is recommended:

1. Mosquito Control (Regional Service):

Mosquito Control is a Regional Service provided by the FVRD. This year unexpected higher peak levels in the Fraser River resulted in more than normal mosquito larvae requiring additional treatment. The FVRD took an aggressive approach to mosquito control in efforts to alleviate the

nuisance these mosquitoes cause for residents who were required to stay close to home, as opposed to travelling this year, due to the global pandemic.

The costs of these works was budgeted at \$248,000, yet cost \$350,100. The excess over budget, \$102,100 will be funded in three ways (1) use of Surplus balance \$6,500 (2) reduced contribution to 2020 surplus \$44,600 and (3) the balance remaining \$51,000 will need to be included in the 2021 Financial Plan as an expense. The Local Government Act requires deficiencies to be carried forward to the next year's budget and included as an expense in that year.

Due to the immediacy of the situation, the funds were spent to ensure these services happened in a timely manner in June. This report seeks direction to amend the Financial Plan to include the expenditures for this initiative.

COST

If directed, the amendment proposed in this report will be incorporated into the Five-Year Financial Plan by bylaw and brought back to the Board for adoption in early 2021.

CONCLUSION

As a result of circumstances arising during 2020, there is one additional amendment to the Five-Year Financial Plan that is recommended to ensure Staff have the appropriate authority to incur these expenditures required to effectively manage FVRD services.

COMMENTS BY:

Jennifer Kinneman, Chief Administrative Officer: Reviewed and supported. Options to address the remaining balance will be considered as part of the scheduled Committee of the Whole budget meeting in January.

CORPORATE REPORT

To: Regional and Corporate Services Committee From: Lance Lilley, Manager of Environmental Services Date: 2020-12-08 File No: 2320-83-001

Subject: Nuisance Mosquito Control Program 2020 Year End Report

INTENT

This report is intended to advise the Regional and Corporate Services Committee of information pertaining to 2020 mosquito control season. Staff is not looking for a recommendation and has forwarded this information should members want more clarification to discuss the item further.

STRATEGIC AREA(S) OF FOCUS

Support Environmental Stewardship Support Healthy & Sustainable Community

PRIORITIES

Priority #3 Flood Protection & Management

BACKGROUND

As part of the Fraser Valley Regional District (FVRD) Floodwater Mosquito Control Program, the FVRD conducts thorough monitoring and larval treatments each spring and summer. The FVRD's contractor for this service, Morrow BioScience Ltd., has submitted a year-end report summarizing its efforts during the 2020 mosquito season.

DISCUSSION

2020 provided challenges for mosquito control all across the Province where floodwater mosquitoes are an annual problem, including in the Fraser Valley. The large amount of late-season snow in the upper portions of the Fraser River watershed and the local precipitation experienced in May and June contributed to a Fraser River freshet in the Fraser Valley that peaked higher than normal, peaked later than normal, and remained at elevated levels for a significantly prolonged period of time. This continued high water level as the days became warmer created ideal mosquito breeding conditions, especially when combined with a second peak of the river that flooded more mosquito breeding habitat than the first peak.

In 2020, the Fraser River peaked initially on June 5th at 5.39m. This is approximately normal for both timing and river level, and if river levels declined following this peak it would have resulted in relatively typical mosquito larvae activity levels. The slow and continual melt of snow in the upper river basins that accumulated in April, May, and June this year kept Fraser River levels elevated though, and rather

than dropping, instead caused a second river peak to occur on June 30th (5.91m). These conditions necessitated repeated and wide-spread larval treatments.

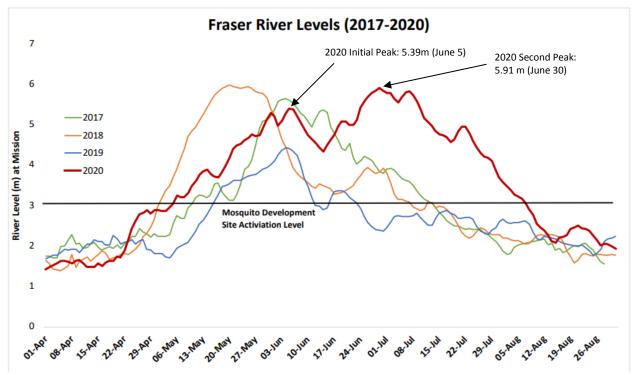

Figure 1. Fiver River levels (m) recorded at the Fraser River (Mission gauge, 08MH024) as reported by the River Forecast Centre: 2017-2020. Mosquito larvae typically start to become active when river levels exceed 3m (i.e., when above the black horizontal line).

Monitoring for larvae activity began at the end of April and the first larvae treatments occurred in early May. Treatments were then repeated, both by ground and by helicopter, up until August 17th, much later than treatments are usually required. As comparison, the final treatment in 2019 was conducted two months earlier, on June 21. The final treatment that was needed in 2018, a year that reached a comparable peak river level, was almost six weeks earlier. The lateness of the hatch meant that the adult mosquitoes unfortunately persisted throughout the summer, whereas usually they begin to decline in abundance in early July, if not sooner.

In total, 19,935 kg of granular *Bacillus thuringiensis israelensis* (Bti) as well as 70,000 ml of liquid Bti was applied in 2020. 2,446 hectares of mosquito breeding habitat was treated. This was the largest amount of area treated, and the most Bti required, since prior to 2009. During 2012, another bad mosquito year due to peak flows on the Fraser River that year that reached 6.4 m and caused localized flooding within the region, only 14,489 kg of pesticide needed to be applied over a total of 2,012 hectares of mosquito breeding habitat.

Based on post-treatment monitoring data collected, each time Bti is applied it reduces the number of mosquito larvae by 85-95%. Based on the extremely high larvae abundance in 2020, despite the intensive treatment effort, the remaining 5-15% of surviving larvae that hatched into adults were

enough to cause unfortunate annoyance in many lowland areas near the Fraser River. As a result, 130 calls were received on the Mosquito Hotline this year, up from only 4 in 2019.

In addition to the water level and the abundance of active mosquito larvae, Covid-19 provided some additional challenges this year. Due to the restrictions on social gatherings and in-person contact, our contractors replaced their usual community outreach efforts with added information on their website and increased social and traditional media presence. The contractors also had to ensure worker safety by reducing the number of people permitted in company vehicles, their boat, or in the helicopter during aerial treatment campaigns. Due to the experience of the crew and the pilot however, these limitations are not believed to have significantly impacted the treatment efficacy. In addition, due to the large amount of Bti used this year and some challenges in bringing additional supplies up from the US due to the pandemic, there was some concern about product shortages. Morrow BioScience was able to eventually secure sufficient volumes from elsewhere in BC and obtain an adequate amount needed for our region.

While it is hoped that 2020 floodplain mosquito conditions in the Fraser Valley remain an anomaly and that 2021 conditions will be better, our contractors will be prepared to provide the necessary monitoring and treatment to keep mosquito abundances as low as possible. Morrow BioScience is preordering Bti early in the year to ensure its timely arrival, and will have Covid safety policies already in place next year. An additional adult mosquito monitoring trap will also be installed in northwest Abbotsford to better track species composition and relative mosquito abundance. This new trap will complement the other trap in Abbotsford (at the JAMES plant), as well as the traps in Hope, Agassiz, Mission, and Chilliwack.

COST

Due to the unforeseen costs needed this year for pesticide and repeated treatment applications, total expenditures (including staff time) associated with the program in 2020 will be approximately \$444,000. This exceeds the amount budgeted for 2020 (\$393,000), with the estimated deficit of \$51,000 carried forward into 2021 due to a lack of surplus funds in this account. With recent budget increases, it is expected that the surplus account will be able to be replenished over the next 2-3 years, allowing for greater ability to absorb the added costs needed for high water years that require additional mosquito treatments.

CONCLUSION

Prolonged and late season high water events contributed to an ideal mosquito breeding season in 2020. In response to this, treatment efforts were increased to cover more area and utilize more pesticide than had been done in the recent past. COVID-19 provided additional operational challenges, but were able to be mitigated.

FRASER VALLEY REGIONAL DISTRICT MOSQUITO CONTROL PROGRAM 2020 YEAR-END REPORT

Prepared by: Morgan Sternberg, Research Manager, Morrow BioScience Ltd. info@morrowbioscience.com 1-877-986-3363

Morrow BioScience Ltd. (MBL) has now completed the second year of a five-year contract as mosquito control contractor for the Fraser Valley Regional District (FVRD). This is the 17th consecutive year providing floodwater mosquito control for the FVRD. The mosquito control program reduces floodwater mosquito abundance within all areas of the FVRD. Most control activity takes place along and within the Fraser River from Hope to Abbotsford/Mission.

The snowpack in basins contributing to the Fraser River were considerably high leading into the 2020 floodwater mosquito season. A warming trend in late May within contributing snow basins led to most of the low elevation and some middle elevation snowmelt. This snowmelt resulted in the initial peak of the Lower Fraser River at the Mission gauge (June 5; 5.39 m). Unstable weather in River-associated snow basins occurred from early to mid-June. A secondary warming trend within contributing snow basins occurred from mid to late-June, resulting in residual middle elevation and high-elevation snowpack depletion. This warming trend also led to the official peak of the Lower Fraser River on June 30 (5.91 m). The 2020 Lower Fraser River peak occurred approximately 2-3 weeks later than normal, was nearly 1 m higher than the 19-year average, and was higher than 3 m for a record-setting 95 days. The Fraser River also rose relatively slowly and peaked when local ambient temperatures and local precipitation accumulation were high. All of these factors contributed to high larval abundance in 2020.

Between May 5 and August 17, a total of 2,446 hectares was treated by ground and helicopter. A total of 13 aerial treatment days were required this season, with two larger campaigns (i.e., Fraser Valley-wide treatments) divided over numerous days due to weather delays. Total treated area in 2020 is the most area treated since prior to 2009, at least. Treatment efficacy was assessed as high and no known sites were missed. However, MBL staff were not able to accompany helicopter pilots during aerial treatments due to COVID-19 restrictions. Thus, it's possible areas of the Fraser River islands were not treated as thoroughly as usual. In the future, GIS treatment layers will be provided to the helicopter company prior to aerial campaigns, if MBL staff members are unable to accompany. A real-time monitoring and treatment data dashboard was again provided to the FVRD program manager. The dashboard enables managers to view up-to-date treatment information and ensure quality control.

Adult mosquito trapping revealed a total of 365 specimens over 56 trap nights at historically established locations throughout the FVRD. The high adult trap volume may be a function of increased trapping effort (i.e., more than twice the average number of trap nights), the sustained high Fraser River levels, and a compound number of mosquito eggs hatching in 2020. Regional adult mosquito species identification revealed a high percent composition of floodwater *Aedes* species and *Coquillettidia perturbans*, which reflect increased floodwater and emergent vegetation mosquito development habitat available in 2020. Accordingly, concern call volume was also higher than average, totaling 130. Five concern emails were received. The majority of calls and emails were received 2-3 weeks

following the initial peak of the Fraser River in early June. All calls and emails were returned within 24 hours.

Communications with in-program First Nations bands and residents remains a priority for MBL. COVID-19 gathering restrictions reduced the potential for in-person education outreach and volunteer events. As a substitute, MBL added information pamphlets and blogs available through the MBL website (www.morrowbioscience.com) and also directly from the FVRD. MBL staff provided a total of five (5) interviews to local newspapers and television news outlets. Interviews focused on the seasonal outlook, mosquito biology, and tips for personal protection. The reach of social media posts continues to increase annually, meaning that more residents around the FVRD are aware of mosquito abatement efforts.

Season Highlights

- The snowpack in basins contributing to the Fraser River ranged from 97-147 % of normal in April, immediately preceding the onset of the mosquito season.
- The Lower Fraser River freshet and local precipitation created a bi-modal appearance to river levels in 2020.
- A region-wide warming event within contributing basins prompted considerable low and mid-elevation snow melt conditions in late May, resulting in the initial peak of the Fraser River (June 5; 5.39 m).
- A higher secondary peak occurred on June 30 (5.91 m) in response to regional warming events in the second half of June.
- The peak was the highest since 2018 and occurred 2-3 weeks later-than-average.
- Thirteen (13) aerial treatments were required throughout the FVRD region in 2020. Events ranged from May 15 July 5 and were clustered around the two prominent freshet-influenced peaks in 2020.
- Liquid and granular Aquabac[®] (a.i., *Bacillus thuringiensis* var. *israelensis*) treatments occurred in 2020, with liquid treatments being conducted solely at Stave Lake.
- Combined, ground and aerial Aquabac® treatments totalled 19,935 kg granular Aquabac® and 70,000 ml liquid Aquabac®.
- Total area treated was 2,446 ha; the 2020 total treated area is approximately 590 ha greater than that treated in 2018, another high-water year.
- Adult traps were set on 56 nights, collecting 365 adult specimens.
- Another set of adult mosquito specimens from 11 trap locations (i.e., 56 trap nights, 486 specimens) were collected at regional sites outside of the FVRD. Inferences based on those species composition results will be used to understand the FVRD adult mosquito population.
- *Aedes* species accounted for 53.9%, over-all.
- *Coquillettidia perturbans* accounted for 26%, over-all.
- *Culex* species only accounted for 6%, over-all.
- *Aedes japonicus* was identified from an adult mosquito trap located in the City of Coquitlam. The specimen was also independently verified and reported to the Director of the Entomological Society of BC at the University of British Columbia

- Mosquito hotline concern call volume was 130, which may be representative of the high water year, sustained high water, and a compound number of mosquito eggs.
- Five emails were received.
- MBL's real-time data management and mapping portal provided MBL managers with improved ability to target areas and gave quality control assurance for clients.
- Education outreach was focused entirely online through social media, additional Frequently Asked Question documents for *Bacillus thuringiensis* var. *israelensis*, mosquito biology, and COVID-19.
- The MBL Operations Manager provided interviews to CTV (July 3), Global News (July 10), Mission City Record (July 14), and The Chilliwack Progress (July 15).
- No human cases of West Nile virus or Zika virus were reported in BC.
- Relatively few West Nile virus cases (humans, horses, mosquito pools) were reported in Washington and Idaho states; all infections were reported in the southern half of both states.

Introduction

Morrow BioScience Ltd. (MBL) is the longest-operating mosquito control firm in British Columbia, having conducted mosquito control in this province for nearly four decades. MBL has been the mosquito control provider for the Fraser Valley Regional District (FVRD) since 2004. A 5-year contract was re-established in 2019; the 2020 mosquito season marked MBL's 2nd year within the new term.

The FVRD contains a large spatial area of mosquito development sites, considerable habitat variation, and the largest river in BC. These variables make the FVRD mosquito control program particularly complex. Within the previous 17 years, MBL staff has acquired thorough knowledge of the program regarding site locations and effective treatment timing. Numerous improvements have been made to the program since its inception, including: Fraser River island site survey and site addition, the addition of a real-time data collection and review portal, increased public engagement both through social media and through in-person events, and improved environmental awareness through annual carbon offset purchases. MBL's goal is to continue to provide effective mosquito control to the FVRD residents, while remaining socially and environmentally responsible.

Carbon Offsets

The spatial reach and scope of the FVRD mosquito program is such that driving is an inevitable requirement. The accumulated mileage over the course of 2020 was approximately 32,800 km (ground transportation only).

As an estimation, the driving requirements for this program result in the production of approximately 8.9 tonnes of CO_2 emissions. To offset this addition of CO_2 to the environment, MBL has committed to purchasing carbon offsets. To fulfill this commitment, carbon offsets are purchased through the West Kootenay EcoSociety¹. When the carbon offsets are purchased, a proof of purchase and certificate from the offset provider will be delivered to the FVRD.

Methodology

Floodwater mosquito larvae are the primary target of the FVRD mosquito program. Female floodwater mosquitoes (e.g. *Ae. vexans, Ae. sticticus*) deposit their eggs on damp substrate along the Fraser River corridor. When the high water caused by the freshet and/or significant localized precipitation floods these areas in the spring, the result is large-scale mosquito egg hatching. If numerous seasons have passed between high-water years, then high river levels may produce a compound number of mosquito larvae. While study results vary, Breeland and Pickard (1967) estimate that *Aedes vexans* eggs can remain viable for up to four (4) years while they await necessary hatching cues.

MBL field technicians begin monitoring all known mosquito development sites within the FVRD prior to rising Fraser River levels in the spring (Image 1). When Fraser River levels start rising, monitoring efforts increase. Communication with the public assists staff in locating new sites, as well as acquiring historical knowledge of the program area.

Image 1. MBL field technician checking dipper for mosquito larvae

Larval mosquitoes in sufficient number (i.e. >4/dip) are treated by ground applications of the microbial larvicide, Aquabac®. This product has the active ingredient Bacillus thuringiensis israelensis (Bti). In 2020, the granular and liquid formulations of Aquabac[®] were used. The granular form is carried on a corncob mixture and the liquid form is water-based. The mode of action for Bti is the same for both formulations. The mode of action for Bti is relatively simple and with a high degree of species specificity. Receptors within the mid-gut region of the mosquito larvae are specific to the toxin

proteins that are produced alongside each bacterial spore. After the mosquito larvae ingest the toxin protein, disruption of the larval mid-gut cells occurs. This event causes considerable damage to the wall of the mosquito larvae's gut and quickly leads to larval death (Boisvert and Boisvert 2000).

As the season progresses and more mosquito development sites become flooded, it is increasingly difficult to treat sites by ground due to inaccessibility and concurrent site activation. At this point, a helicopter is used to conduct aerial treatments. The aerial campaign uses the same pesticide as ground applications, although typically with a higher application rate to permeate canopy cover. Aerial treatments take approximately two days per campaign, due mostly to the level of flooding involvement on the Fraser River islands. In 2020 aerial campaigns (i.e., large-scale treatment of the Fraser Valley and Fraser River Islands) were broken up in 2, 3, and 5 day periods due to weather-related delays.

It is important to time treatments according to the correct stage of larval development (3rd and 4th instar). If treatments are applied too early, the larvae will not have reached their highest feeding rate yet and if applied too late, the larvae molt into pupae (i.e. non-feeding stage). Both circumstances may result in the development of adult mosquitoes. Additionally, by waiting until mosquito larvae are in the 3rd and early 4th instar stages, early instar larvae are available as food sources in their ecosystem.

When flooding commences and ambient temperatures rise, many standard dips easily exceed the treatment threshold. Larval densities within the range of 200-500 per dip (observed as high as 1,000 per dip) are commonly detected. All sites are checked within one or two days of the initial treatment to ensure treatment efficacy. Efficacy assessments at sites treated aerially are typically conducted by boat or canoe. If sites are unsafe to access by either of those methods, then representative sites are selected to assess efficacy. Touch-

ups are conducted, as required. Anecdotal field results from the previous 17 seasons show that efficacy is between 85-95 percent.

Environmental Conditions

The three main environmental conditions that affect the Fraser River levels throughout the mosquito season (e.g. April – July) are: 1) the snowpack in snow basins contributing to the Fraser River, 2) ambient temperature in snow basins contributing to the Fraser River, and 3) local precipitation. Local ambient temperature is also of interest due primarily to how local ambient temperature affects mosquito egg hatching and larval development rates. As such, all noted conditions are tracked throughout the season.

Snowpack

Floodwater mosquito abundance within the FVRD is primarily influenced by regional Fraser River water levels. In turn, the water levels of that system are largely dictated by the freshet released from the Fraser, Thompson, and Nechako Plateaus between April and July (Image 2). The Fraser River is also influenced by tidal variations and high, spatially concentrated precipitation accumulation, although to a lesser degree. When snowpacks exceed 100 percent of normal and when regional precipitation accumulation is above normal, higher Fraser River levels are expected during the mosquito season.

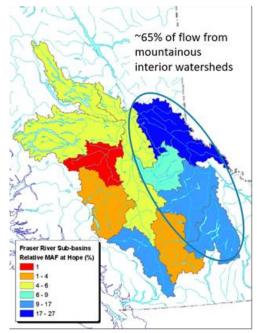

Image 2. Fraser River sub-basin freshet contribution (A. Jollymore; River Forecast Centre)

In April, immediately preceding the 2020 mosquito monitoring season, the basins influencing the Fraser River freshet ranged from 97 - 147 percent of normal (Table 1). Cool and dry weather within influential basins throughout April resulted in comparably little snowmelt over the month. While an initial snowmelt was observed in most basins in

40

www.morrowbioscience.com

early-May, unstable weather patterns from April through mid-May also resulted in considerable late-season snow accumulation.

4

Table 1. Snow basin indices (2012-2018 average, 2020) for basins that directly affect the Lower Fraser River flood plain, determined by the 1 April 2020 Snow Survey and Water Supply Bulletin. Values reported are considered percent of normal.

Basin	Average April Snowpack (2012-2018)	2020 April Snowpack

A longer and more intense warming event occurred at the end of May within influential basins. This warming event caused most low and some middle-elevation snowpack to melt. For the most part, basins were depleted of remnant middle elevation and high-elevation snowpack following a warming event in the second half of June. However, the residual high-elevation snowpack within the Upper Fraser East basin wasn't depleted until mid-July.

In general, the snowpack remained within influential basins for 2-4 weeks beyond normal. Data from the final Snow Survey and Water Supply Bulletin from June 15² highlighted the anomaly of the snowpack persistence in 2020. The percent of normal snowpack was still exceeding 100 percent in over half of the contributing basins (Table 2). In fact, four of the six basins showed higher values in 2020 than in 2018, another high-water year (Table 2). While the River Forecast Centre suggested cautious interpretation of the reported percentages, the considerably high 'percent of normal' snowpack remaining as of 15 June reflected the rarity in late-season snowpack persistence.

 Table 2. Snow basin indices for basins that directly affect the Lower Fraser River flood plain, determined by the June 15 (2018, 2019, 2020) bulletins. Nechako 20 0 0

Given 2020 snow station report figures, the majority of the 2020 Fraser River freshet ostensibly lasted from early May through early July³. Within that time, the freshet was exacerbated by stints of high regional precipitation accumulation in May and June (see 'Local Precipitation' below). The effect of these two variables resulted in high water within the Lower Fraser River persisting for a significantly longer period than normal.

Local Precipitation

Significant temporally and spatially concentrated precipitation accumulation may elevate Fraser River levels. Local precipitation can also temporarily increase seepage site levels, where considerable mosquito development habitat is located. Thus, tracking local precipitation accumulation can aid MBL field staff with determining how long mosquito development sites may require management. The Mission West Abbey weather station (ID: 1105192) provides both historical precipitation accumulation averages (i.e.1981 – 2020) and also current-year totals, allowing for the comparison of current-year environmental conditions with historical conditions. This comparison allows for some level of prediction regarding larval mosquito development rate and treatment timing requirements.

Precipitation received to the Mission West Abby weather station in April was markedly lower than normal (Figure 1). This is consistent with the documented few unstable weather systems in April, despite cooler temperatures. Precipitation received to the area within May and June was greater than average (Figure 1). Thus, precipitation in these months likely augmented rising Fraser River levels and associated seepage sites. Precipitation events during May and June also caused some delays in aerial campaigns, such that campaigns needed to be divided between multiple days.

Precipitation accumulation in July 2020 was less than half of that received in the previous month. Specifically, precipitation received in July was only 67 mm (Figure 1). However, 68 percent of the precipitation received in July occurred from the $1^{st} - 3^{rd}$ while Fraser River levels were still showing signs of a late-season freshet. Thus, the precipitation received to the area within the first few days of July, likely compounded a peaking Fraser River at Mission (see 'River Levels' below). The relatively low amount of precipitation received in the latter portion of July was of little consequence to the regional Fraser River levels and associated mosquito development sites.

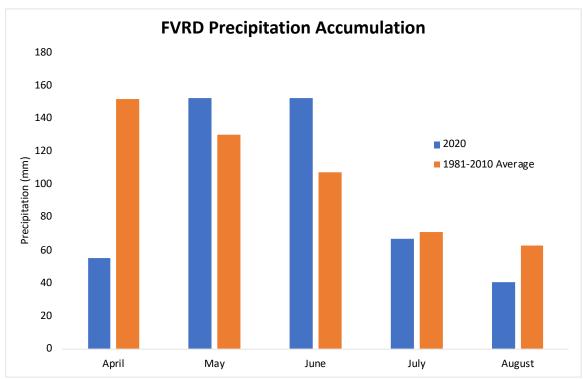

Figure 1. 2020 precipitation values (rainfall and snow accumulation; mm) recorded at the Mission West Abby Station (ID: 1105192) for 01 April – 31 August (blue) and average station precipitation values (1981-2010; orange).

August precipitation accumulation was approximately 40 mm and more than 20 mm less than the average accumulation for that month (Figure 1). Given these data, it is reasonable to determine that local precipitation did not measurably augment regional Fraser River levels in August. By August the Fraser River and associated seepage site levels had receded below the threshold for mosquito egg hatching, and thus the low precipitation accumulation in August didn't impact late-season mosquito larval hatching. However, it's possible that precipitation received in August created habitat for container mosquito breeding. Thus, adult mosquito presence toward the end of the season was likely due to container mosquito hatches, not floodwater species.

Ambient Temperature

Ambient temperature, both locally and within the contributing snow basins, is an important variable to track. From April through August, local ambient temperature fluctuations can affect mosquito egg hatching, larval development rate, adult dispersal, and adult survival. Ambient temperature within contributing snow basins dictates the commencement and sometimes the concentration of the freshet.

Across the snow basins most influencing the Fraser River freshet, the 2020 mosquito season began in April with below-normal temperatures. The May 1st Snow Survey and Water Supply Bulletin⁴ noted that temperature anomalies across most of the province were generally from 0°C to -2°C. A small amount of snowmelt occurred in Fraser River-

6

⁴ https://www2.gov.bc.ca/assets/gov/environment/air-land-water/water/river-forecast/2020_may1.pdf www.morrowbioscience.com

associated basins in April, but the generally cooler weather in April resulted in a delay of the freshet by approximately 2 weeks.

Although ambient temperatures in May within Fraser River-associated snow basins was comparatively higher than those recorded in April, they were still considered cooler-thanaverage in the middle of the month. A ridge of high pressure within those basins in later May led to the majority of low and some mid-elevation snowmelt. The late-May higher ambient temperatures experienced within contributing basins would eventually lead to the initial peak of the Fraser River at Mission (i.e. June 5; 5.39 m).

Ambient temperature within much of the Province during the first half of June was dominated by low-pressure systems. The low-pressure systems were cooler within Fraser River-associated basins and further slowed the residual high elevations snow from coming out. A more consistent warming trend in mid-June caused the remaining snowmelt to accelerate, resulting in the official peak in the Fraser River at Mission (i.e. June 30, 5.91 m). Temperature data are consistent with 2020 automated snow station data⁵ depicting snowmelt points correlating with regional ambient temperature spikes.

If the ground proximate to the Fraser River contains floodwater mosquito eggs and if hatching conditions are present (i.e. low dissolved oxygen, higher ambient temperatures), then mosquito egg hatching will commence (Mohammad and Chadee 2011). Thus, local ambient temperature is a predictive tool when gauging floodwater egg hatch commencement. Local ambient temperature data are acquired from the Mission West Abbey weather station (ID: 1105192).

To illustrate the effect of ambient temperature on mosquito hatching, Trpis and Horsfall (1969) exposed submerged eggs of a common univoltine floodwater mosquito species, Aedes sticticus, to various constant air temperatures and recorded hatching success. Results revealed that eggs began to hatch at 8°C, although larval development was slow and survivorship was low. Eggs held at 21°C provided the optimal temperature, of the five temperatures tested, for hatching and larval development (Figure 2). While Ae. sticticus is not the sole floodwater species present in the FVRD, it serves as a representative species for our purposes and provides general developmental benchmarks.

⁵ https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-science-data/water-data-tools/snow-surveydata/automated-snow-weather-station-data www.morrowbioscience.com

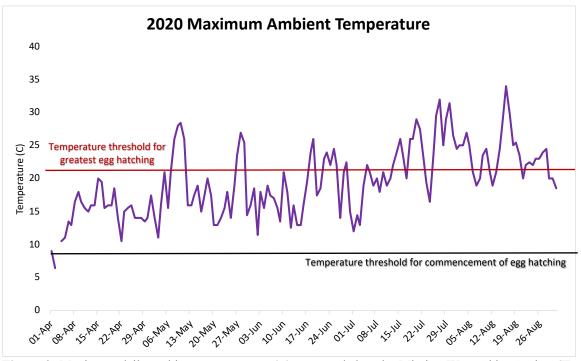

Figure 2. Maximum daily ambient temperatures (C) as recorded at the Mission West Abby Station (ID: 1105192) 01 April – 31 August 2020. Lower black line illustrates threshold at which *Ae. sticticus* eggs commence hatching; upper red line illustrates threshold at which most *Ae. sticticus* eggs hatch.

Within the FVRD, the 2020 season began with higher-than-normal ambient temperatures for April. The monthly average for April (14.6 °C) was 1°C higher than the station average for April. Thus, floodwater mosquito eggs within the FVRD were likely activated within April if exposed to flooding conditions (Figure 2). However, the larval development at cooler temperatures would have been notably slow (Trpis and Horsfall 1969). The potential for larval development – even in the early portion of the mosquito season – is the primary reason for site monitoring commencement in April.

Local ambient temperatures in May were relatively warmer and closer to those most favourable larval development conditions (Figure 2). Specifically, the average maximum daily temperature for May was 2°C higher than average at 18.6°C. Mosquito egg hatching and larval development rates increased significantly in May, with larval treatments required starting in early May.

Ambient temperatures in June were generally higher than May temperatures, although still lower than average. A warming trend toward late June facilitated further mosquito hatching and increased larval development rates. Because considerable floodwater development sites were at peak levels, the need to treat mosquito larvae in June was directly correlated with ambient temperature.

As predicted by the Temperature and Precipitation Probabilistic Forecasts for Canada, July and August ambient temperatures were higher than average. The combination of peak regional Fraser River levels and high ambient temperatures resulted in ground and aerial treatments continuing into July (see 'Larval Control' section). By August, regional Fraser River levels were receding and ambient temperature was no longer directly related to floodwater larval mosquito abundance. However, ambient temperature does increase development rates for larval and adult mosquitoes (Ciota et al. 2014). Thus, any floodwater mosquitoes that successfully emerged would have had a reduced lifespan with the heightened ambient temperatures into late August (Figure 2).

Localized mosquito annoyance due to container mosquito presence occurred in July and through August. Container mosquito habitats near residential homes can be created throughout the summer whenever the presence of water is coupled with high ambient temperatures. Thus, ambient temperature more directly affects container mosquito production in July and August. MBL technicians regularly inform residents that adult container-bred mosquitoes can be reduced around homes by ensuring container mosquito environments are either free of water or refreshed frequently.

River Levels

Within the FVRD, the majority of floodwater mosquito development sites are found along the flooding corridors of the Fraser River and associated seepage sites. As the presence of water is the prime hatching cue for floodwater mosquito eggs, springtime Fraser River levels provide predictions about the extent of floodwater mosquito egg hatching.

A pulse of water came through regional river systems from contributing snow basins in late April, marking the commencement of the 2020 Fraser River freshet (Figure 3). Fraser River levels (Mission gauge; ID: 08MH024) continued to increase through May and initially peaked on June 5 (5.39 m) following a provincial warming trend in late-May. Cooler weather within contributing basins occurred in the early half of June, slowing the snowmelt, and resulting in a reduction in river levels (Figure 3).

A more consistent warming trend occurred in the latter half of June within basins contributing to the Fraser River freshet. Despite the majority of the snowpack within contributing basins at greatly reduced states and Lower Fraser River Water Level MIKE11 model⁶ predicting a secondary, lower peak, the Lower Fraser River hit a higher peak on June 30 (Figure 3). The secondary peak of the season was over half a meter higher than the initial peak. Specifically, the Lower Fraser River peak for 2020 was 5.91 m. The considerable high-elevation snowpack in the Upper Fraser East basin and high local precipitation were two major contributors to the 2020 Lower Fraser River peak.

The Fraser River's peak height relative to recent seasons is a predictive variable that may help explain an associated year's larval abundance. If the current year's regional river levels far exceed that of preceding season, mosquito eggs laid between the high-water mark of both years could have remained dormant until current-year flood waters trigger their hatching. Because the peak of the Fraser River was far over 1.5 m higher in 2020 than in 2019, it is highly likely that the 2020 peak level triggered dormant eggs to hatch.

⁶ http://bcrfc.env.gov.bc.ca/freshet/lower_fraser/LFR-10-DayFloodLevelForecasts.pdf www.morrowbioscience.com

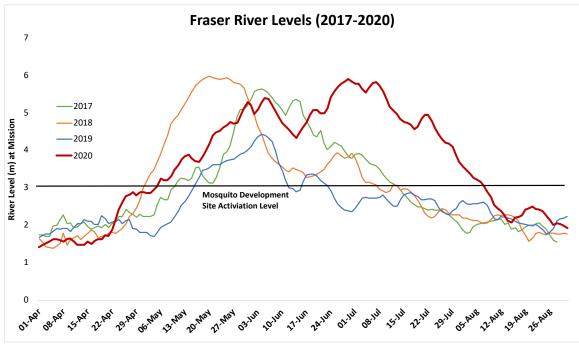

Figure 3. 2017-2020 river levels (m) as recorded at the Fraser River (Mission gauge, 08MH024), and as reported by the River Forecast Centre. Horizontal black line indicates level at which River-associated mosquito development sites become active.

Another predictive variable to describe the extent of mosquito larval abundance within a given year is the length of time the Fraser River at Mission is higher than 3 m. The horizontal black line in Figure 3 denotes the Fraser River height threshold (i.e. 3 m) at which mosquito development sites within the FVRD have been observed to become active. In 2020, the Fraser River reached that point on 6 May. The Fraser River remained above the 3 m threshold for 95 days in 2020. This total exceeds the total days above 3m observed in 2018 (i.e. 67 days), the most recent high-water year. Although the 2018 peak was higher than the 2020 peak, the difference was only 0.08 m. Additionally, the 2018 peak occurred in mid-May when hatching cues were less prominent (Figure 3). Thus, mosquito development sites were not only wet for the bulk of the mosquito season in 2020, but local ambient temperatures were also higher during peak periods, resulting in abundant hatching cues that likely exceeded those of 2018.

The Fraser River rose at a relatively slow, consistent rate in 2020 (Figure 3). When the River rises in this manner, floodwater mosquito eggs laid on substrates at various river levels have optimal environmental hatching cues. When river levels rise at high rates in the early portion of the season, the typically cool highly oxygenated water moving through the system makes it more challenging for mosquito eggs to hatch. However, because the initial and subsequent 2020 peaks occurred in June, ambient temperatures were ideal for mass mosquito egg hatching events and high larval development rates.

By mid-July 2020, all the snow basins contributing to the Fraser River were depleted of snow⁷. This depletion corresponds with a marked decline in the Fraser River levels by late July at the Mission gauge (Figure 3). When the Fraser River levels consistently remain

10

below 3 m, associated seepage sites reduce quickly. Thus, by early August many of the mosquito development sites were dry.

Larval Control

Monitoring within the FVRD began in late April. Appendix I A-C shows a map of larval densities found throughout the 2020 season. Larval abundance is assessed in the field using a system of ranges (0, 1-4, 5-49, 50+) for early and late instar mosquito larvae. In order to transfer these data to a frequency map (Appendix I), data are ultimately summarized and assigned to a hexbin representing an area of 21.65 ha. Only wet sites were included in the analysis. An intensity value representing the relative number and life stage of the larvae are assigned to each single sample. For each sample, late instar larvae ranges are weighted more heavily than early instar larvae ranges to indicate targeted life stage and treatment urgency. In this way, each sample is assigned an intensity value from 0 to 1. All sample intensity values are then averaged by hexbin. Thus, each hexbin is assigned an average intensity value from 0-1. The intensity value thresholds within Appendix I denoting 'low', 'moderate', 'high', and 'very high' were assigned based on biological significance and operational urgency.

Hexbins are used to aggregate point data, making general data trends visible at large scales. The primary drawback and disclaimer to hexbin analysis is that generalizations must be made. In general, hexbins denoted as 'None Detected' (i.e. white) or 'Low' (i.e. light sandy colour) indicate the average sample contained < 5 larval mosquitoes per dip. In most cases, hexbins with a moderate frequency (0.2875 - 0.525 intensity value; light orange colour) or greater indicate those which had an average of > 5 mosquito larvae per dip. Hexbins can contain one or greater sample point, may contain sample points that lie directly on hexbin borders, or contain treatment area associated with a point that is officially housed within a neighbourng hexbin; each of these circumstances may create skewed results.

In certain cases, hexbins denoted as 'Non-Detected' or 'Low' do have treatments associated with them (Appendix II A-C). In these cases, treatments may have been triggered by the larval activity of a representative site. Typically, sites that are located on Fraser River islands or those that are difficult to access may be associated with representative sites. Historically, when representative sites become active the other sites in the area have proven to also be active. Thus, sites with a previous designation of 'Non-Detected' or 'Low' may require a later treatment due to representative sites' activity level without the need to sample. Of note, the areas with highest recorded larval abundance amongst known sites are Dewdney, Mission, Silverdale, Kent, and Seabird Island (Appendix I A-C).

Ground treatments started on May 5, indicating the close correlation between the 3 m Fraser River level and treatment requirements (Figure 4). Most ground treatments took place between early-May and mid-June with the rise of the Fraser River beyond 3 m (Figures 4, 5). However, ground treatments again increased with the second, higher peak in Fraser River levels.

Aerial treatments were also clustered around the two Fraser River peaks of the season (Figure 6). Technically, 13 aerial treatment days occurred within the FVRD in 2020, including two at Stave Lake on 28 May and 19 June. Two larger aerial campaigns were broken up in 2020 due to the large treatment areas and weather events restricting flight; the two campaign events were clustered around 10-12 June and 1-4 July (Figure 6). Aerial campaigns are generally considered region-wide treatments of the Fraser River Islands and valley. The total number of aerial treatment days (i.e., 13) in 2020 was six more than was conducted in 2018, the closest high-water year with comparable treatment area. The high total number of aerial treatment days in 2020 is a reflection of high water for an unprecedented number of days, coupled with frequent weather systems during aerial events that resulted in campaign delays. Appendix II A-C provide maps depicting where and how frequently treatments (i.e., ground and aerial, combined) took place in 2020.

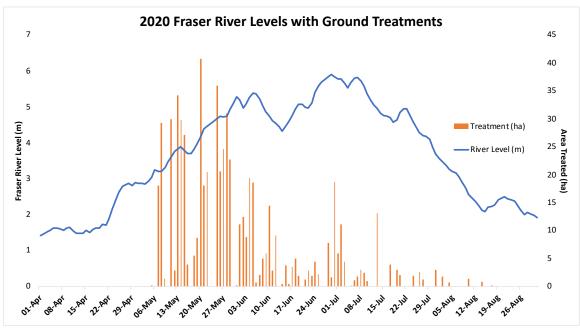

Figure 4. Fraser River levels (m; Mission gauge) and total mosquito development area treated by ground (ha) from April 1 – August 31, 2020.

Relative to the low-water year of 2019, floodwater mosquito development habitat was considerably increased in 2020 due to high snowpack in basins associated with the Fraser River and also to various local, large precipitation events. The Fraser River peaked during a period of high ambient temperatures which created ideal mosquito hatching environments. Additionally, the Fraser River at Mission remained above 3 m for 95 days, resulting in significantly increased need for mosquito larval treatments. River levels didn't start to recede below 3 m until mid- August. Ground treatments also tapered-off by mid-August. For perspective, ground treatments in most years are completed by mid-July. The final ground treatment took place on August 17 - the relative lateness of which is a reflection of all forementioned environmental factors occurring immediately prior to and during the 2020 mosquito season (Figure 4).

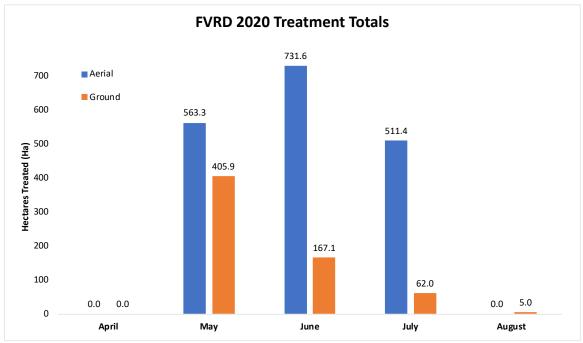

Figure 5. 2020 treated area (ha) by method (i.e. ground vs. aerial) and month from April – August.

Ground treatments were applied at a rate of 4 kg/ha. A total of 643 ha was treated by ground, equating to a total of approximately 2,572 kg of granular Aquabac® used (Figure 7). Typically, sites only require one treatment per season unless additional mosquito larvae are pushed into the site due to the movement of water. This season, certain sites needed to be treated multiple times due to prolonged mosquito development site existence. Additional treatments occurred at higher water levels than initial treatments, hence the treatment overlap is minimal.

Aerial treatments were conducted using both granular and liquid Aquabac®, with the same active ingredient. To compensate for increased canopy cover, aerial treatments were applied at a rate of approximately10 kg/ha using the granular product and 1,000 ml/ha using the liquid product. The liquid Aquabac® was used exclusively at Stave Lake. A total of 1,806 ha was treated by air, equating to a total of 17,363 kg of granular Aquabac® and 70,000 ml of liquid Aquabac® (Figures 6, 7). No known sites were missed in 2020 and no new sites were discovered. However, due to COVID-19 restrictions, MBL staff members were not able to accompany and guide pilots in 2020 and, thus, it is possible that sites were not treated as thoroughly as usual. The high number of concern calls associated with Fairfield Island indicate the possibility that sites on that island may have been over-looked. Appendix III shows more specific information about site, treatment timing, and extent of treatment for both ground and aerial treatments.

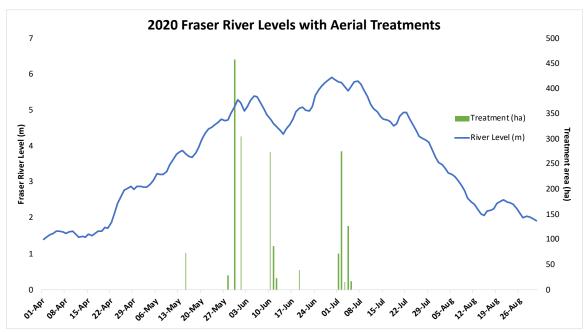

Figure 6. Aerial application events (green lines; ha) and Fraser River levels (blue line; m) as recorded at the Mission gauge from April 1 through August 31, 2020.

In comparing treatment areas since 2016, the total treated area exceeded all years, including the most recent high-water year of 2018 (Figure 7). Total treated area in 2020 surpassed total treated area in 2018 by 591 ha. In fact, the total treated area in 2020 was greater than the treated area in any year since prior to 2009. The record high treatment amount and area in 2020 is due to the higher-than-average snowpack in contributing basins, the prolonged snowmelt resulting in consistently high Fraser River levels, precipitation received locally during freshet peak(s), and the primary peak occurring during high ambient temperatures.

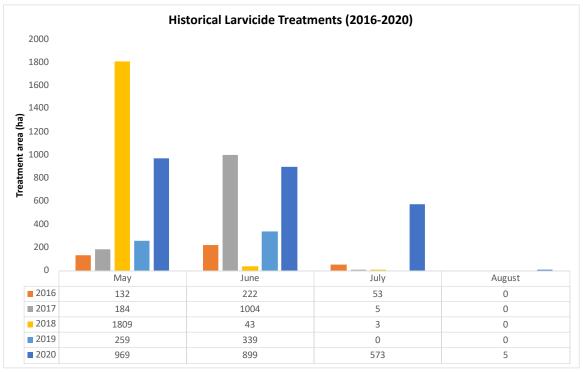

Figure 7. Historical Aquabac® treatments (ha) for May, June, July, and August (2016-2020). Treatments include ground and aerial applications.

Adult Mosquito Trapping

This year is the 9th consecutive year in which adult mosquito trapping stations have been established throughout the FVRD. The primary intention of the adult mosquito trapping program is to determine relative adult mosquito abundance, which serves as a quality assurance/quality control measure for larval mosquito control activities conducted by MBL technicians. Trap data allow MBL to compare intra and inter-annual nuisance levels.

Adult mosquito trap locations include the Hope Wastewater Plant, Abbotsford Wastewater Plant, Kent Wastewater Plant, Mission Raceway, and the Chilliwack Wastewater Plant. Monitoring inter-annual adult mosquito abundance at historical locations throughout this timeframe has enabled a comparison of abundance between years. Of note, adult mosquito counts include both male and female specimens.

A New Jersey Light trap was placed at each location and connected to a timer. These traps rely on mosquitoes' attraction to the heat and intensity of the light. A fan is attached to the trap, as well, which draws in mosquitoes that have been attracted to the light. The timer for the light was set to go on just before dusk and off just after dawn, capturing the time of the day when mosquitoes are most active. Instead of the standard light used in the light traps, a grow-light was used to increase trap counts.

Adult traps were set-up on May 14. Traps were checked approximately every 2 weeks between May 28 and August 24 (Table 3). At each set-up, trap functions were assessed and were all working properly prior to the sample night. Unfortunately, on four occasions,

certain traps were found to have been unplugged at the collection event (Table 3). A total of 56 trap nights were conducted in 2020, which is approximately twice the average of trap nights calculated from 2011-2019.

Table 3. 2020 adult mosquito count by trap location and date. All N/A entries denote days in which traps were found to have been unplugged.

	Hope Wastewater Plant	Abbotsford Wastewater Plant	Kent Wastewater Plant	Mission Raceway	Chilliwack Wastewater Plant

13-Aug	4	0	0	30	0
24-Aug	2	0	0	20	1

Historically, adult mosquito trap abundance appears to have been directly related to the height of the lower Fraser River levels (Figure 8). However, using a simple correlation analysis with data since 2014, a correlation co-efficient (i.e. R) value of 0.294 is calculated. This is a considerably basic understanding of the relationship between adult mosquito production and Fraser River levels, acknowledging the relatively low power given the small sample size. The low correlation co-efficient suggests the two variables are not strongly related in their variation. The low R-value likely reveals that additional variables may account for greater portions of annual variation in adult mosquito abundance. A regression analysis may provide better understanding of the effects of multiple environmental conditions on the regional mosquito population. For example, more in-depth analyses might include the variables of precipitation, the number of days the Fraser River was higher than 3 m, potential for compounded number of mosquito eggs, and the management effort to name a few variables.

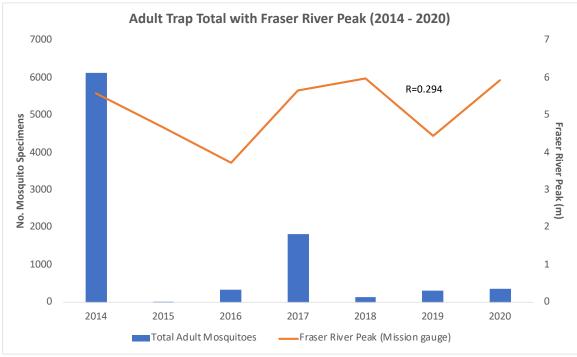

Figure 8. Total FVRD adult trap mosquito specimens with peak Fraser River level (Mission gauge) for 2014-2020. The correlation co-efficient (R) for the two variables is also indicated.

A total of 365 adult mosquito specimens were collected from FVRD traps in 2020 (Figure 8). This total is lower in comparison to 2014 and 2017, despite having a higher peak Fraser River level. In contrast, the 2020 trap total is higher than other years, including 2018, which had a slightly higher peak Fraser River level (Figure 8). It is likely that the extended highwater in 2020, in comparison to that of 2018, is partly responsible for the increased number of adult mosquitoes. Additionally, the total number of trap nights in 2018 was 35, as compared to 56 trap nights in 2020. Thus, comparisons between all years must take trap nights into consideration and interpret comparisons carefully.

The trend in 2020 adult trap abundance followed bi-modal curve, with the highest number of adult mosquitoes collected at the June 18/24 events (i.e. 39 mosquitoes) and at the July 17 event (i.e. 46 mosquitoes; Table 2). The high abundance of adult mosquitoes collected from those trap nights is likely due to dispersal from the initial Fraser River peak in early June and the primary peak at the end of June. Typically, adult mosquitoes begin to disperse at least 2-3 weeks after the peak in the regional Fraser River levels. Depending on wind direction and velocity, the dispersal may be accelerated or decelerated.

The highest number of adult mosquitoes was collected from the Mission Raceway trap, with the exception of the few nights that the trap had been unplugged (Table 2). Matsqui Island, which is immediately across a channel of the Fraser River, has considerable mosquito development habitat. Micro-mosquito development sites were likely created as a function of heavy debris movement on the Fraser River islands. These sites were transitory, and the displacement of the larval mosquitoes was difficult to locate and, thus, to treat. It is likely that mosquitoes that were able to emerge in 2020 dispersed directly to the Mission Raceway area.

Adult mosquito specimens from FVRD traps were discarded following counting. However, mosquito specimens from 11 trap locations (i.e., 56 trap nights, 486 specimens) were collected at regional sites outside of the FVRD. Site similarity and proximity to FVRD trap sites enable species composition extrapolation with relative confidence. Future efforts to ensure trap content preservation includes increased staff training, clearer chain-of-custody forms, and continued development of the real-time data collection application.

Adult mosquito specimen identification was conducted using a 60X microscope. Mosquito identification was conducted by a trained professional using keys developed from Wood et al (1979) and Darsie and Ward (2005). The species confirmed in the adult traps were *Aedes vexans, Ae. sticticus, Ae, cinereus, Ae. punctor, Ae. canadensis, Ae. japonicus, Culex tarsalis, Cx. Pipiens, Cx. Incidens,* and *Coquillettidia perturbans*. Certain indistinguishable specimens were either unknown or identified as either the *Aedes* or *Culex* genus.

Adult traps were established on May 7, 23, and 28, but no adult mosquitoes were caught. During the period in which adult mosquitoes were caught (i.e., June 5 – August 20), floodwater mosquito species were found in high abundance. The abundance and frequency of floodwater mosquitoes throughout the season is indicative of the length of time that floodwater mosquito habitat was active in 2020. The floodwater or floodwater-associated species that comprised the bulk of specimens were *Aedes vexans*, *Ae. sticticus*, and *Coquillettidia perturbans* (Figure 9).

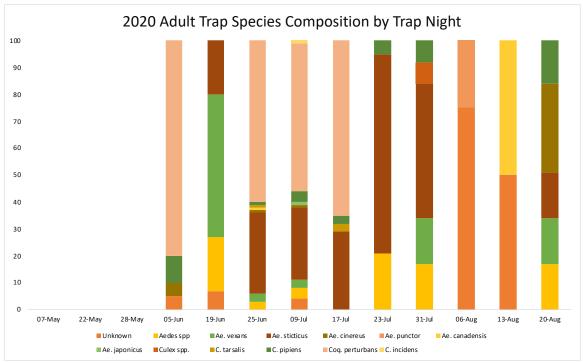

Figure 9. 2020 adult trap species composition by trap night from traps within the Lower Mainland outside of the FVRD.

An additional trend to note is the increase in container/temporary natural environment mosquito species (i.e., *Culex pipiens, Cx. tarsalis)* toward the end of the summer season (Figure 9). As ambient temperatures increase, container mosquito species or those that can

be found in temporary natural environments increase. The confirmation of *Aedes japonicus* from July 9 trapping efforts in City of Coquitlam is also important to discuss due to its rare occurrence and a success as a vector for West Nile virus, St. Louis encephalitis, dengue, chikungunya, and Japanese encephalitis. The species was first reported in British Columbia in 2015 (Jackson et al. 2015). The specimen was confirmed by a secondary source and reported to Director of the Entomological Society of BC at the University of British Columbia. While *Ae. japonicus* has not been identified within the FVRD, there is comparable habitat to the area in which the specimen was collected.

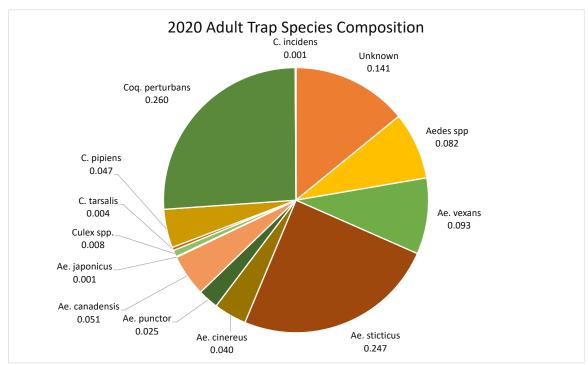

Figure 10. 2020 mosquito species composition from adult mosquito trap established throughout the Lower Mainland outside of FVRD.

Overall, *Aedes* species comprised the majority of the species in 2020 traps (i.e., 53.9%; Figure 10). As the dominant floodwater species, *Aedes* species were found throughout the mosquito season, indicating the long-term presence of floodwater habitat and continuous hatching cues. *Coquillettidia perturbans* comprised the next highest percentage of species (i.e., 26%). The primary habitat for *Cq. perturbans* is emergent vegetation, and more specifically *Typha* species (Batzer and Sjogren 2012). Consistently high Fraser River levels of 2020 may have created additional habitat for *Cq. perturbans*. The high presence of *Cq. perturbans* was also noted in similar abundance and from similar areas by Jackson and Patterson (2018) during the high-water year of 2018. Thus, higher-water years may yield greater habitat and hatching cues for *Cq. perturbans*. Known areas with high *Cq. perturbans* presence or suitable habitat should be prioritized in high-water years. There was a relatively smaller percentage of *Culex* specimens in 2020 (i.e., 6%) in comparison to trap results in 2019. Reasons for this discrepancy are unknown, however may be due to a reduction in potential habitat given the high, moving water.

Maintaining positive public relations remains a high priority for MBL. Public relations occur on several levels: in-person communication with members of the public, the mosquito hotline, presentations to staff and politicians, responding to e-mails, and continuing our social media presence. MBL continues to look for new areas to expand this aspect of our program and to improve our communication techniques.

Phone Calls and Emails

The total number of calls received in 2020 was 138. Of those, the total number of concern calls and emails received in 2020 was 130. Eight (8) calls were inquiry-based and primarily received in April, with residents requesting adult mosquito abundance predictions for the up-coming mosquito season or to ensure certain sites would again be treated in 2020. A total of five (5) emails were received. This high number of concern calls and emails is a reflection not only of a high Fraser River peak and the considerably long span the Fraser River levels were maintained, but also a reflection of a compound number of mosquito eggs from the 2019 season.

The majority of hotline calls and emails (i.e. 69 %) was received between 23 and 27 June (Figure 9). Adult mosquitoes begin to disperse from mosquito development sites approximately 2-3 weeks after the peak in the regional Fraser River levels. Thus, it was not surprising that the highest mosquito hotline call volume occurred within that timeframe following the initial peak of the Fraser River on June 5 (Figure 9).

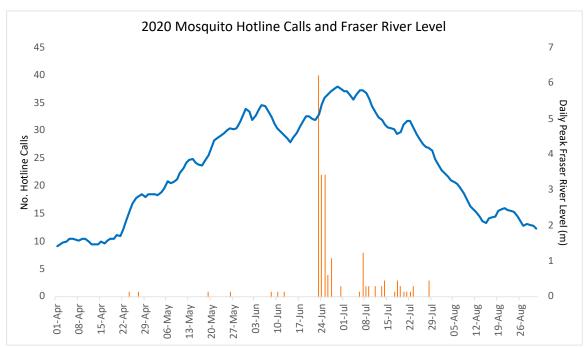

Figure 11. 2020 MBL mosquito hotline call volume by day with Fraser River daily peak (m; Mission gauge).

Appendix IV is a map of concern call distribution throughout the FVRD. The majority of calls was received in Chilliwack (i.e. 76 %). More specifically, most of those calls were from Fairfield Island. That area of Chilliwack is greatly affected by any mosquitoes that may have emerged from the considerable flood plain near Fairfield Island as well as nearby Carey Island and Comry Island. It is possible that certain mosquito development sites of Fairfield Island may have been over-looked during aerial treatments due to the inability of MBL staff members to accompany and guide helicopter pilots in 2020. If MBL staff members are unable to accompany helicopter pilots in the future, a pre-flight treatment GIS layer will be provided to pilots. Mission, Abbotsford, and Deroche were where the next highest percentage of calls came from (i.e. 5%, 4%, and 4%, respectively). The Appendix IV map indicates the close proximity of Mission and Abbotsford to Matsqui Island, and of Deroche to the prominent Nicomen Slough. Matsqui Island and Nicomen Slough have large mosquito development sites that, despite treating the greatest number of hectares since 2009, produced adult mosquitoes capable of dispersing to nearby communities.

The total number of concern calls in 2020 is considerably higher than the low number (i.e. 4) of concern calls recorded in 2019. This disparity is likely due to the significant difference in Fraser River peak levels, directly relating to the difference in active mosquito development area between the years. To illustrate the extent of flooding in 2020, Image 3 shows Cheam Campground largely under water on July 2.

Image 3. Cheam Campground on July 2, 2020.

www.morrowbioscience.com

All calls were returned within 24 hours of receipt if a phone number was provided. All emails were responded to within the same timeframe. Often, follow-up calls were also made to residents who had emailed if phone numbers were provided.

Direct Communications

Direct communication between MBL staff and the public can occur under many circumstances. The most common direct interfacing with the public occurs when technicians are in the field. While conducting site visits, MBL technicians are often asked questions by landowners or residents. These encounters provide an excellent opportunity for public relations. The fact that technicians are visibly monitoring and treating assures

residents that attention is being given to mosquito abatement efforts. Additionally, an important outcome of these interactions can be the identification of new sites.

MBL contact information is disseminated when field technicians have direct communication with the public. Contact information for MBL includes the website address, an email, phone number, and social media sites (Twitter, Facebook).

Additionally, MBL staff may Image 4. MBL outreach pamphlet example

provide residents with an outreach pamphlet (Image 4). The pamphlet includes information about the larval control product used, mosquito biology, and personal protective tips.

Education Outreach

For the 9th consecutive year, MBL has maintained a presence on social media. MBL has a Facebook account (facebook.com/MorrowMosquito), Twitter account (@MorrowMosquito), and Instagram account (linked to Facebook) which are regularly updated. Each platform includes posts regarding where monitoring events are taking place, what the environmental conditions are, and general larval abundance. As of 17 November 2020, the MBL Facebook page was up to 330 followers, which is an increase of 24 followers since this time in 2019. This season, the highest reach (i.e. 2,147) for a post most relevant to the FVRD mosquito control program occurred on May 19 (Image 5). The post was specific to monitoring and treatment activities occurring within the FVRD at mosquito development sites affected by the rising Fraser River.

22

Image 5. Facebook photo with description of MBL staff monitoring and treating Fraser River-associated mosquito development sites (May 19, 2020)

advance of any media release.

Given the provincial restrictions placed on large gatherings to reduce the spread of COVID-19, MBL enacted a company-wide policy to invest in virtually-available education outreach material instead of attending public events. As such, the (www.morrowbioscience.com) MBL website highlighted two sets of FAQs focused on (1) mosquito biology and disease transmission (Appendix V) and (2) the active ingredient used in efforts (Bacillus thuringiensis control var. israelensis) (Appendix VI). Additionally, a blog dedicated specifically to mosquitoes and COVID-19 was published on the MBL website (Appendix VII).

A media release was generated and approved by the FVRD program manager for distribution to a radio station in Abbotsford and a radio station in Chilliwack. Follow-up calls were made, but the story was not picked up. If radio-based education outreach is a focus of future efforts, contacts with local radio stations will be solidified farther in

MBL staff members provided interviews to numerous sources during the 2020 mosquito season. Specifically, CTV (July 3), Global News (July 10), Mission City Record (July 14), and The Chilliwack Progress (July 15). All interviews described the reasons lending to high Fraser River levels in 2020 and provided water level predictions in line with provincial predictions. Additionally, MBL staff highlighted tips to reduce mosquito breeding habitat around private properties and suggested personal protective measures.

West Nile virus Summary

Although floodwater mosquito species in Canada are not primary West Nile virus (WNv) vectors, it is important to remain current in regional mosquito-related diseases. Along with its partners, the Government of Canada conducts on-going surveillance of WNv cases in humans between May 18 and August 29. Within that timeframe, there were no confirmed human case of WNv reported in BC⁸. Similarly, no horses or birds were confirmed to be positive for WNv within 2020, thus far. Of note, mosquito pool surveillance data is not reported to Health Canada from BC.

As Washington State and Idaho State share a border with British Columbia, it is important to follow WNv activity in those areas, as well. As of October 4, there were two human cases of WNv in Washington State; both were acquired in-state within counties in the

⁸ https://www.canada.ca/en/public-health/services/diseases/west-nile-virus/surveillance-west-nile-virus/west-nile-virus-weeklysurveillance-monitoring.html www.morrowbioscience.com

southern area of the state⁹. Additionally, 11 mosquito pools tested positive for WNv. No birds or horses/other mammals tested positive for WNv in 2020.

As of September 22, two human WNv cases were identified in Idaho¹⁰. Additionally, multiple mosquito pools tested positive for WNv. No bird specimens tested positive for the virus. All cases were identified within counties in the southern and southwestern portion of Idaho.

Zika virus Summary

No information regarding Canadian Zika cases has been reported by the Public Health Agency of Canada for 2020. However, HealthLinkBC reports that no Zika cases have originated in Canada due to presumed lack of vector mosquito species¹¹. There have been human Zika cases reported in Canada prior to 2020, although those were determined to have been acquired while traveling.

According to Peach (2018), the primary Zika mosquito vectors (i.e. *Aedes aegypti, Ae. albopictus*) are not found in BC. *Ae. albopictus* has been found on east coast, but tested negative for Zika. There is currently a low risk for Zika virus to circulate within BC.

Program Reminders

A number of important issues must be addressed at the start of each season:

- Notify the Ministry of Environment of the FVRD intent to treat mosquitoes in 2021 under the FVRD Pest Management Plan. Notification should take place 2 months before the start of the season (the end of February at the latest).
- It is important to attach copies of all the mosquito development site maps with the Notice of Intent to Treat (NIT). NOTE: all sites have been re-mapped. This new data should be used to reprint maps for the purposes described above.

Category 1: Mosquito Ecology

Question 1: What type of mosquitoes are controlled by Morrow BioScience Ltd (MBL)?

Most mosquito control program operated by MBL focus on one complex of mosquitoes, those that develop in floodwaters, primarily during the Spring freshet (e.g. Aedes vexans, Aedes sticticus). However, certain programs within BC also have snowmelt mosquito species (e.g. Aedes communis). The females of these snowmelt species lay eggs in depressions within the landscape that allow for snowmelt or precipitation to accumulate. Eggs are able to hatch under considerably cooler conditions than those of floodwater or container mosquito species. At this time, MBL does not control mosquito species typically found in containers (e.g. Culex pipiens).

Question 2: Why doesn't MBL control container mosquitoes like those in residential backyards and catch basins?

At this time, MBL doesn't focus on treating containers (i.e. catch basins, bird baths, gutters, old tires, etc.) to control container mosquito species primarily because most of the container mosquito development sites are located on private property. While sometimes producing enough mosquitoes to create very localized annoyance, they don't create broader nuisance levels. Although MBL doesn't specifically target container mosquitoes, field and outreach staff have developed messaging aimed at informing residents of proactive measures that can reduce container mosquito habitat around their homes. Measures include refreshing stagnant water daily during the height of the season, ensuring gutters are cleaned and not holding water, removing old tires, covering rain barrels with a fine mesh to prevent mosquitoes from accessing, and many more.

Question 3: What conditions need to be present for floodwater mosquitoes to hatch?

Floodwater mosquito eggs are triggered to hatch when submerged by fresh floodwaters, typically occurring as a result of the Spring freshet in BC. As water warms up in the late spring, larvae develop faster.

Question 4: What environmental factors in BC govern floodwater mosquito development?

Tracking environmental factors that affect the flooding capacity within an area is important. Flooding in BC typically occurs in the Spring as a result of the Spring freshet from snow basins contributing to local rivers. Snowpacks vary inter-annually. When snowpacks in contributing basins are low, the freshet usually follows suit and when they are high, the freshet is comparatively high. A high freshet means more mosquito eggs may be activated to hatch,

especially if previous seasons' freshets resulted in low local river levels. Snowpacks in BC are assessed by automated snow weather stations throughout the year and can be found at: <u>https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-science-data/water-data-tools/snow-survey-data</u>.

Significant local precipitation accumulation may also elevate local river levels. Local precipitation can temporarily increase seepage site levels, where mosquito development habitat is located. Thus, tracking local precipitation accumulation can aid MBL field staff with determining how long mosquito development sites may require management. Local weather station data can be found at: <u>https://climate.weather.gc.ca</u>

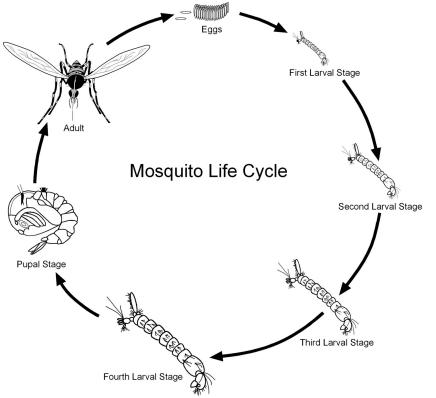

Question 5: Why are adult mosquitoes most abundant after the peak in local rivers?

Peak river levels represent the time at which the majority of floodwater mosquito eggs have been triggered to hatch for the season. The time from when an egg hatches to emergence and dispersal is typically 2-3 weeks (although this is highly dependent upon water temperatures). So even as local river levels are receding, mosquito development may still be taking place. Adult floodwater mosquitoes are strong enough to disperse from their hatch site quickly and are able to fly multiple kilometers in search of a blood meal. Significantly warm weather increases the rate at which a mosquito develops and may lead to more aggressive activity toward the end of a mosquito's lifespan.

Category 2: Mosquito Development

Question 1: What is the lifecycle of floodwater mosquito species within the program area?

Source: North Shore Mosquito Abatement District (https://www.nsmad.com)

Floodwater mosquito eggs are laid in the damp substrate along floodwater corridors. Flooding along with other appropriate environmental triggers (i.e. sufficiently warm, low dissolved oxygen) allow for the eggs to hatch into larvae. The larvae go through four aquatic instar stages, which are also the primary feeding stages, prior to developing into pupae. Pupae then emerge into adults. The development process can take as little as four days in some species and conditions to as long as two weeks. Development times also depend on ambient and aquatic temperature, with warmer water resulting in accelerated mosquito development.

Question 2: At what life stage are mosquitoes targeted for control?

MBL does not conduct adult mosquito control. Adult control requires the use of pesticides with considerable indirect and non-target effects. Instead, MBL targets the larval stage of the mosquito. Mosquito larvae are the feeding stage of the life cycle, which makes the larval instars particularly susceptible to larvicides dependent on ingestion. Specifically, the 3rd and early 4th

larval instars are the target of MBL's floodwater mosquito control program. Larvicides are more effective in the latter instar stages and earlier instar stages are left as biomass for the aquatic food web.

Question 3: How far can mosquitoes fly from their hatch site?

Maximum flight distance from hatch site varies widely dependent upon species. A common floodwater, Aedes vexans, may fly greater than 4 km from their hatch site, on average. The main implication of these data is that uncontrolled mosquitoes may impact people from distances farther than 4 km, in some circumstances. MBL endeavours to reduce mosquito annoyance to residents in all areas within the contract purview.

Category 3: Disease Transmission

Question 1: What diseases can mosquitoes transmit in Canada?

In Canada, mosquitoes have been shown to transmit West Nile virus, Eastern Equine encephalitis virus, and California serogroup viruses. West Nile virus is the most widely distributed vector borne disease in North America. As the climate in Canada becomes warmer, the environment is more hospitable to additional vectors and associated viruses.

Question 2: Is West Nile virus a concern in BC? What are the most recent levels?

West Nile virus (WNv) is only a slight concern in BC given the relatively few number of mosquito pools, birds, horses, and humans who have tested positive. From 1 January – 12 October 2019, one positive human WNv case was detected in BC. In that same year no animals, no mosquito pools, and no birds tested positive for the virus. Certain container mosquitoes, such as Culex pipiens and Culex tarsalis, are primary WNv vectors. In warmer seasons, more container mosquito breeding occurs, leading to greater potential for WNv transmission.

To reduce WNv exposure through mosquitoes, MBL and the BC Centre for Disease Control urges residents to:

- remove or refresh standing water daily in the warmer months,
- ensure that outdoor plants or containers have a drainage hole,
- clear rain gutters of debris and make sure they drain,
- turn over wading pools when not in use, and
- install screens on windows and doors.

Question 3: Where can I go to find more information about West Nile virus?

Health Canada maintains a thorough surveillance website, organizing cases by type (i.e. human, animal, mosquito), week, and province from mid-April through October. The Health Canada site also provides health-specific information surrounding WNv. It can be found at: <u>https://www.canada.ca/en/public-health/services/diseases/west-nile-virus.html</u>

The BC Centre for Disease Control (BCCDC) website also contains health-related information for residents. The BCCDC site has a more detailed map of surveillance activity by region. It can be found at: http://www.bccdc.ca/health-info/diseases-conditions/west-nile-virus-wnv

Question 4: Can mosquitoes act as a vector for COVID-19?

At this time, there is no evidence that mosquitoes are involved in the spread of COVID-19 (SARS-CoV-2). It is thought that the COVID-19 virus may not survive the internal processes of the mosquito. Other supportive evidence for the inability of mosquitoes to act as vectors COVID-19 is that other Coronaviruses have not proven transmissible through mosquitoes.

Question 5: Where can I go to learn more about the potential for mosquitoes to transmit COVID-19?

The Center for Disease Control addresses the potential for vectorization of COVID-19 in mosquitoes: <u>https://www.cdc.gov/coronavirus/2019-ncov/faq.html</u> The World Health Organization also addresses this question: <u>https://www.who.int/emergencies/diseases/novel-coronavirus-2019/advice-for-public/myth-</u> busters

FACT: To date there has been no information nor The new coronavirus evidence to suggest that the new coronavirus could be transmitted by mosquitoes. CANNOT The new coronavirus is a respiratory virus be transmitted through which spreads primarily through droplets mosquito bites generated when an infected person coughs or sneezes, or through droplets of saliva or discharge from the nose. To protect yourself, clean your hands frequently with an alcohol-based hand rub or wash them with soap and water. Also, avoid close contact with anyone who is coughing and sneezing. Category 1: Operations and Treatment Need

Question 1: Why do we use a larvicide product to control mosquitoes?

Most mosquito control programs focus on one complex of mosquitoes, those that develop in floodwaters, primarily during the Spring freshet. These mosquitoes come out in areas where predation is relatively low, and in numbers that overwhelm the ecosystem. Appropriately conducted larval controls can significantly reduce the severity and duration of these infestations.

Mosquito control products primarily target the larval (aquatic) or adult stages of the mosquito lifecycle. Controlling mosquitoes in the larval stage before they emerge as adults better focuses treatment, as larval mosquitoes are located within a more predictable and confined area than adult mosquitoes. Fewer treatments are required if they are timed appropriately, reducing program costs and environmental impact of treatment. Finally, the bacterial larvicides utilized by MBL have considerably fewer non-target and indirect effects associated with inadvertent exposure than adult mosquito control pesticides.

Question 2: How are bacterial larvicides different from other pesticides?

The larval control product utilized by Morrow BioScience Ltd. (MBL) certified pesticide applicators is Aquabac [®]. The active ingredient is a soil-borne bacterium, Bacillus thuringiensis var. israelensis (Bti). The efficacy of Bti relies upon the natural bacterium and associated toxin protein to be ingested by the mosquitoes. The toxin protein requires four specific receptors found within the gut of mosquitoes to activate the toxin. With few exceptions within the Dipteran taxa, the four receptors found within mosquitoes are lacking in other taxa. Thus, the Bti is considered non-toxic to, fish, amphibians, reptiles, mammals, and most insects.

The non-target and/or indirect effects of other mosquito control products, however, are almost all higher. For example, adult mosquito control products with malathion inhibit cholinesterase, which is a neurotransmitter enzyme. As such, non-target or indirect exposure to this active ingredient can be toxic to other aquatic organisms, birds, and mammals. The mode of action for Bti is relatively simple and with a high degree of species specificity. Receptors within the mid-gut region of the mosquito larvae are specific to the toxin proteins that are produced alongside each bacterial spore. After the mosquito larvae ingest the toxin protein, disruption of the larval midgut cells occurs because of cleavage of the protoxins by mid-gut proteases. This event causes considerable damage to the wall of the gut and quickly leads to larval death (Boisvert and Boisvert 2000).

Question 3: What is involved in this type of treatment?

Morrow BioScience Ltd. (MBL) certified technicians conduct site larval monitoring prior to treatment. Bti treatments target the 3rd instar stages to target the primary feeding stages and to leave early instar larvae as food for others within the ecosystem. Treatments are conducted in compliance with the IPM Act. Larvicide will be applied via hand, a backpack sprayer, or helicopter as determined by the qualified MBL technician. Aerial treatment notices will be posted and will remain on site for a minimum of 1 week. The posted public notice will include the following information:

- The trade name and active ingredient of the larvicide;
- The date and time of the larvicide treatment;
- The purpose of the treatment;
- Precautions to be taken to prevent harm to people entering the treatment area;
- The PMP confirmation number and
- The contractor's contact information.

Question 4: Can I do this on my own property?

Residential mosquito control products are available for purchase at local stores. The use of commercial pesticides on private land now requires a Residential Applicator Certificate (RAC). Residents do not require a RAC to use Domestic class pesticides on their property. Residents can apply pesticides listed on Schedule 2 and 5 without a RAC. The RAC is free to obtain on-line, see www.mytrainingbc.ca/homepesiticideuse/ for more information.

It is extremely important that residential treatments ONLY occur in self-contained and man-made bodies of water. This could include constructed ornamental ponds, un-used pools, or other reservoirs located and constructed solely on the related property. Water bodies that are connected to a natural environment should be reported to local authorities who can assess the need for, and appropriateness of, treatments.

Question 5: Where are the Aquabac® treatments applied?

Aquabac® (Bti) treatments may be applied within the client's purview, with compliance to the product label, provincial legislation, and regional legislation. These treatments primarily take place in floodwaters associated with the freshet.

Question 6: Do land owners have the right to refuse Aquabac® treatments?

Land owners have the right to refuse access.

Question 7: I do not want/will not allow Aquabac® treatments on my property, are there any alternatives?

The most effective control method for mosquitoes around a residence is to reduce, remove, or refresh standing water where mosquitoes can breed. Specifically:

- Empty water in old tires, buckets, toys, and flower pots
- Refresh water in bird baths, fountains, wading pools and animal dishes at least every 3 days
- Clean roof gutters and ensure proper drainage
- Fix leaky sprinklers and outside faucets

Question 8: When Aquabac® is applied by helicopter in high traffic areas, how will residents be warned?

Treatment notices will be posted prior to treatment and will remain on site for a minimum of 1 week. The posted public notice will include the following information:

- The trade name and active ingredient of the larvicide;
- The date and time of the larvicide treatment;
- The purpose of the treatment;
- Precautions to be taken to prevent harm to people entering the treatment area;
- The PMP confirmation number and
- The plan holder(s) contact information.

Question 9: How is Aquabac® applied?

MBL qualified technicians use back pack blowers and helicopters to apply Aquabac \mathcal{B} .

Question 10: How long does it take for Aquabac® to have an effect on larval mosquitoes?

- Larval mosquitoes are affected within hours of Aquabac ® exposure.
- Within 48 hours, the efficacy rate is between 85-100%.

Updated: 3 May 2020

Category 2: Personal Non-Target Effects

Question 1: Will Aquabac® (Bti) harm my pets?

- Because Bti targets certain larval Dipteran species (mosquitoes, biting flies, fungus gnats), it is highly unlikely that pets will be harmed from Bti exposure.
- When tested on lab animals, acute oral and dermal LD₅₀s (median lethal dosage where 50% of the test subjects are killed) were all greater than the highest dosages tested. These dosages are far greater than those likely to be experienced in the field.

Question 2: Could Aquabac® treatments harm humans?

Toxicological studies indicate an extremely low toxicity profile where test animals are concerned (See Question 1, above). To be registered for use in Canada, products must be proven to be nontoxic to test animals at label-specified application rates. Allowable human exposure rates are 10fold less than the No Observed Adverse Effect Levels (NOAEL) established for test animals, leaving a large buffer for potential inter-species differences between test animals and humans.

Question 3: How far away and for what length of time should people be from Aquabac® treated sites?

Safe distances for the public to maintain are suggested during aerial treatments to avoid being hit by small corn granules impregnated with Bti spores. However, there is no toxicity-based reason to avoid the area. Additionally, there is no restricted-entry interval (REI) for microbial pesticides, such as Bti. As such, the public may be in the treatment area during back-pack application or immediately following aerial application.

Category 3: Environmental Effects

Question 1: How does Aquabac® directly affect non-target aquatic invertebrates, fishes, terrestrial invertebrates, birds, and terrestrial vertebrates?

- Aquatic organisms: Aquatic organisms (non-target inverts & fishes) are generally not affected by Bti exposure.
- Terrestrial invertebrates: Bti is considered non-toxic to the majority of terrestrial invertebrates. However, certain studies have shown impacts on some Lepidoptera (butterfly) when in their larval form and some Nematode eggs (although certain Nematode species' eggs increased following Bti exposure). It is important to consider the low likelihood that Lepidoptera larvae will be exposed to Bti at the rate required to illicit negative impacts.
- Birds: No toxic effects with exposure tests.
- Terrestrial vertebrates: Toxicity tests on lab animals, acute oral and dermal LD₅₀s (median lethal dosage where 50% of the test subjects are killed) were all greater than the highest dosages tested. These dosages are far greater than those likely to be experienced in the field.

Question 2: How long does Aquabac® remain active in the water?

The field half-life for Bti in water ranges from approximately 4 hours to 5 months, depending on UV exposure and organic content of the water. The higher the UV exposure, the shorter the half-life. The higher the organic content, the longer the half-life. The great majority of Bti spores will become ineffective within 24 hours of application in a field setting using Aquabac @ - the primary product utilized by MBL. Other products may allow for Bti spores to be continuously released in the water column for up to 30 days.

Question 3: What is the soil half-life of Aquabac®?

Bti is a soil-borne bacterium, so is naturally found in soil environments. However, in its active form, it can persist for months in basic soil conditions. Bti's toxin proteins are rapidly broken down in soils with a pH < 5.1.

Question 4: What is the mode of action for Aquabac® (Bti)?

The mode of action for Bti is relatively simple and with a high degree of species specificity. Receptors within the mid-gut region of the mosquito larvae are specific to the toxin proteins that are produced alongside each bacterial spore. After the mosquito larvae ingest the toxin protein, disruption of the larval mid-gut cells occurs because of cleavage of the protoxins by mid-gut proteases. This event causes considerable damage to the wall of the gut and quickly leads to larval death (Boisvert and Boisvert 2000).

Question 5: If I notice any effects that I think might be connected to an Aquabac® treatment, who should I contact?

Should an individual feel that they, or their pet, have been affected by a treatment, then they should see their doctor. It is extremely unlikely that any malady is related to the treatment, but worth seeing a certified medical practitioner for clarification (and to determine what the cause may be so a treatment can be offered). The affected individual needs to have information about the application from the contract applicator (product name, where the larvicide was applied, when, etc.). If more information is needed, then they should contact the Operations Program Coordinator at MBL for specific information surrounding the potential indirect or non-target effects of the larvicide. If the person wishes to contact someone beyond MBL, they should be directed to contact Health Canada and report a pesticide incident. If a sufficient amount of information has been provided, Health Canada can determine whether or not the effect is due to that product's exposure. The forms can be found at: http://www.hc-sc.gc.ca/cps-spc/pest/part/protect-proteger/incident/index-eng.php

Category 4: Registration and Permitting

Question 1: Who registers pesticide products in Canada?

• The Pest Management Regulatory Agency regulates all pesticides and pesticide applications in Canada under the Pest Control Products Act.

Question 2: Where can I go to get more information on the product?

 Health Canada's Public Registry has information on all registered pesticides and the pesticide regulatory system. https://www.canada.ca/en/healthcanada/services/consumer-product-safety/pesticides-pestmanagement/public/protecting-your-health-environment/public-registry.html

Mosquito Disease Transmission: Just the Facts, Ma'am.

Mosquitoes are some of the most notorious disease vectors in the world. Because of their worldwide distribution (except for Antarctica), proximity to humans, and inclination to feed off of humans, mosquitoes have been able to spread viral (e.g. West Nile, Zika, Chikungunya) and parasitic (e.g. Malaria) diseases to people throughout the world. Annually, over one million human deaths are attributed to mosquito-borne diseases.

Image 1. Female Ae. aegypti mosquito getting blood meal (Credit: Bryan Reynolds/Getty Images)

But how do they do this?! It turns out female mosquitoes inject some of their own saliva into the host – humans, to name one – to stop the host's blood from coagulating before the mosquito can retrieve the blood (Image 1). If that mosquito has previously fed on a human or other animal infected with certain diseases, those diseases may have been able to replicate within the mosquito without harming it. Thus, when an infected mosquito injects saliva into a host, that host can in-turn become infected.

Yikes!

So, are all viruses and parasites able to be passed from mosquitoes to humans? The short answer is no. Now for the longer answer: some viruses and parasites cannot survive the mosquito's gut (like HIV). Because of that inability, they're unable to establish within the mosquito's cells and replicate. Environmental conditions, predominantly temperature, can also affect how a capable a virus or parasite is at infecting and replicating within a mosquito. Warmer temperatures generally mean that a pathogen is able to replicate at a higher rate within a vector. Finally, the amount of the virus or parasite ingested by the mosquito also determines the ability for the mosquito to transmit the pathogen – the vector competence. The

greater the dose, the greater the vector competence (assuming the pathogen is able to infect and replicate within the mosquito). The main diseases that can be transmitted by mosquitoes within Canada are the California serogroup viruses, eastern equine encephalitis, and West Nile virus (WNv). WNv is the most commonly transmitted mosquito borne

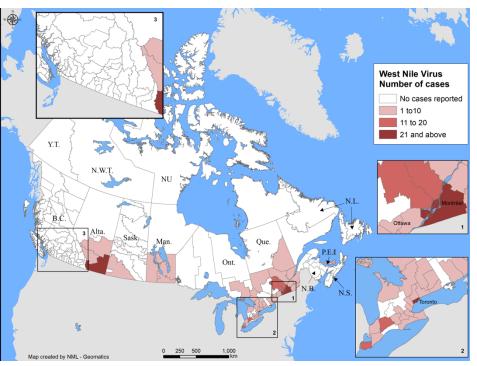

Image 2. 2018 distribution of human West Nile virus cases throughouth Canada (Health Canada)

disease in Canada. In 2018, a total of 432 human cases of WNv were reported in Canada – the highest total since 2007 (Image 2). Large-scale, nation-wide surveillance efforts are conducted to keep track of WNv incidence in horses, birds, and humans. These data give program managers the ability to direct mosquito control efforts.

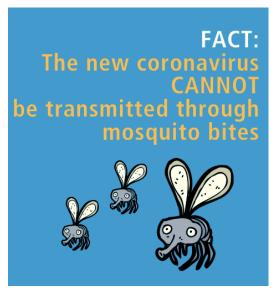

Image 3. World Health Organization myth busters

A big question on people's minds these days is whether the new coronavirus, commonly known as COVID-19, can be transmitted to humans by mosquitoes. To date, there has been **no evidence that COVID-19 can be transmitted by mosquitoes** (Image 3). It is thought that the COVID-19 virus is unable to survive the mosquito's gut to infect and ultimately replicate within the mosquito. To further support this thought, there is also no evidence that other coronaviruses (MERS, SARS) have been transmitted by mosquitoes.

Even if disease transmission is highly unlikely in BC, those bites are a nuisance! We're doing our part to help control mosquitoes in our program areas. You can help reduce mosquito habitat around your home by removing standing water (think clogged gutters, plant holders, un-used kiddy pools) or refreshing water

(think bird baths, outside pet dishes/troughs) daily. Ensure all of the screens on your home are properly installed and maintained. When you're out and about, wear lightweight, long-sleeved

shirts and long pants. Remember that lighter colours are less attractive to mosquitoes than are darker ones. Finally, there may be a time and a place for bug spray – we recommend bug spray with DEET.

CORPORATE REPORT

To: Regional and Corporate Services Committee From: Marina Richter, Environmental Policy Analyst Date: 2020-12-08 File No: 9050-01

Subject: Air Quality Service Agreement with Metro Vancouver

RECOMMENDATION

THAT the Fraser Valley Regional District Board authorize its signatories to execute an Air Quality Monitoring Agreement with Metro Vancouver to not exceed the maximum cost of \$228,600 per year, plus the rate of inflation, for 2021-2030.

STRATEGIC AREA(S) OF FOCUS Support Environmental Stewardship Support Healthy & Sustainable Community **PRIORITIES** Priority #2 Air & Water Quality

BACKGROUND

The Air Quality Monitoring Network in the Lower Fraser Valley (LFV) is a collection of 31 stations which continuously monitors air pollutants. The data collected from those stations form the foundation of knowledge about regional air quality and is used in decision making by both Metro Vancouver and the Fraser Valley Regional District (FVRD) for air quality policies and practices which affect public health. Operation and maintenance of these stations is critically important for air quality management in the LFV airshed.

The FVRD currently hosts six (6) air quality monitoring stations located as part of this network. They are in Abbotsford (2), Mission, Chilliwack, Agassiz, and Hope.

Metro Vancouver operates and maintains the LFV Air Quality Monitoring Network, including the stations within the Fraser Valley on behalf of the FVRD based on a 1998 Memorandum of Understanding (MOU) between the FVRD and Metro Vancouver. With addition of two new stations (in Mission and Agassiz) since this original MOU, there is a need for an updated agreement to account for cost increases and to provide clarification about ownership and responsibilities related to the growing network.

DISCUSSION

An updated Air Quality Monitoring Agreement has been prepared jointly by FVRD and Metro Vancouver. It reflects the continuation of the arrangement with Metro Vancouver for operation and maintenance of the FVRD Air Quality Stations that preserves the integrity of the network and ensures compliance to the best standards and practices. The Agreement formalizes Metro Vancouver's role with regards to this operation and maintenance, and includes equipment inspection and calibration, collection and analysis of air quality data, provision of raw and processed data to the FVRD, working with FVRD staff on issuing of air quality advisories and bulletins, and provision of annual summary reports to the FVRD. The Air Quality Monitoring Station ownership and the full equipment inventory for each station is now clearly identified within the Agreement.

Under the Agreement, the FVRD agrees to continue having a staff person assist, as needed, with data and technical review and to serve as a liaison with air quality matters. The FVRD also agrees to the provision of an Annual Fee to Metro Vancouver for the services they provide. The amount of this Annual Fee, outlined below, represents an increase over the previous rate of \$155,000 per year to account for increases in the cost of labour and materials since 1998 and to account for the additional stations and equipment that have been added to the FVRD portion of the network.

Maintaining Metro Vancouver's participation in the operation and maintenance of all of the air quality monitoring stations within the Lower Fraser Valley Air Quality Monitoring Network, including the stations with the FVRD, is essential for continuity, for data quality, and for economies of scale. If the FVRD were to manage these stations themselves, the cost to do so would be prohibitively greater than under this agreement, and it would limit the ability to analyze data at a regional level for trends or concerns. To-date, this partnership has proven successful and is a great example of collaboration between the two regional districts.

COST

Under the new agreement, the FVRD will pay Metro Vancouver an Annual Fee for the entire cost of providing the services, with a discounted but increasing rate for the first two years, as follows:

- 2021: \$180,000
- 2022: \$205,000
- 2023: \$228,600
- 2024-2030: \$228,600/year plus the rate of inflation as determined by the Consumer Price Index from the previous year.

The increase in the Annual Fee compared to the prior rate was accounted for in the annual budgets for this program during the 2020-2024 FVRD financial planning process.

CONCLUSION

The Air Quality Monitoring Agreement between the FVRD and Metro Vancouver reflects an updated budget, roles, and responsibilities in maintaining the FVRD portion of the network. The Agreement will help ensure continuity, uniformity, compliance and high quality of air quality data that will contribute to our achievement of our goals for clean air in the region.

CORPORATE REPORT

To: Regional and Corporate Services Committee From: Alison Stewart, Manager of Strategic Planning Date: 2020-12-08 File No: 8330-02-19744

Subject: Three-Year Transit Expansion Initiatives Letter – FVX Expansion

RECOMMENDATION

THAT the Fraser Valley Regional District Board confirm its continued support for the previously approved 2021/2022 expansion initiative to extend the Fraser Valley Express service to TransLink's Lougheed Town Centre Sky Train subject to discussion with municipal partners;

AND THAT BC Transit and the FVRD reaffirm its request to undertake more detailed costing analysis and consultation relating to potential expansion of transit service on the north side of the Fraser River between the District of Kent and District of Mission.

AND FURTHER THAT BC Transit reassess the existing Cultus Lake service to ensure it is meeting the community's current needs and expectations.

STRATEGIC AREA(S) OF FOCUS

Support Environmental Stewardship Foster a Strong & Diverse Economy Support Healthy & Sustainable Community Provide Responsive & Effective Public Services

BACKGROUND

At its May 22, 2019 meeting, the FVRD Board confirmed support in principle for 2020/2021 expansion initiatives, including extending the Fraser Valley Express service to TransLink's Lougheed Sky Train station. Support for the FVX expansion was confirmed independently by Abbotsford and Chilliwack Councils and both Councils later provided statutory consent to amend the "Fraser Valley Express Sub-regional Transit Service Area Bylaw No. 1236, 2013" to accommodate the expansion (adopted April 28, 2020).

In late April 2020 the BC Transit Board of Directors announced the deferral of all planned 2020-21 expansion initiatives until 2021-22 in order to focus on maintaining services and supporting recovery in the face of COVID-19. This meant that BC Transit delayed the January 2021 FVX expansion to Lougheed Town Centre in Burnaby until the following fiscal year. BC Transit is now reinitiating some of the initiatives that were put on hold, including expansion planning. With recently announced transit-specific *Safe Restart* funding supporting local governments, additional assistance from BC Transit and a

healthy year-end 2019 FVX Appropriated Surplus balance of \$756,650, there is comfort in recommending that the service expansion proceed as planned. Public details of the *Safe Restart* funding shall be announced shortly.

This memorandum provides an update on BC Transit's "Three-Year Transit Expansion Plan" received on November 20, 2020 (Appendix A) which, among other things, resets the timelines for the FVX expansion to Lougheed Town Centre Skytrain station. Given very tight time-lines, this recommitment must be provided to BC Transit "as soon as possible" to be included in the province's February 2021 budget.

DISCUSSION

Each year BC Transit evaluates numerous expansion requests from Local Government partners throughout the province and communicates back to Local Government through its annual Transit Improvement Program letters, also known as TIPs. The purpose of this evaluation process is to secure commitment from both the provincial government and local partners, allowing BC Transit to proceed with its strategic planning for the upcoming three year funding cycle.

Because of COVID, the annual TIPs letters were not sent out earlier in the year, in fact all expansions were deferred for a year. BC Transit is now in the process of reinitiating some of the initiatives that were put on hold, including expansion planning. BC Transit is asking local governments to confirm their support for proposed expansions previously approved in 2019 in order to be incorporated in the provincial budget in February 2021.

As a result of the COVID-19 emergency, the BC Transit Board of Directors announced on April 21, 2020, that all transit expansions slated for the 2020-21 fiscal year will be delayed until 2021-22. This meant that the approved FVX expansion to Lougheed Town Centre in Burnaby would not take place as expected in January 2021. This expansion was incorporated in the FVRD's 2020 5-year financial plan and budgeted accordingly. In preparing the FVRD's draft 2021 5-year financial plan, the expansion has been pushed back into the 2022 time frame.

New Timelines (as per Provincial Fiscal Year)

<u>2021/22</u>

Extend the Fraser Valley Express service to TransLink's Lougheed Sky Train station at an annual net cost of \$494,000. Implementation could take place in January 2022, a year later than originally intended, should the FVRD wish to move forward on this initiative.

<u>2022/23</u>

Initiatives in years 2 and 3 of the expansion planning horizon will require more detailed planning by BC Transit prior to any meaningful consideration by the FVRD and its member municipalities. For example, the implementation of transit service between the District of Kent and District of Mission will include community engagement and surveying, routing and costing analysis, and a summary of the necessary

next steps if the service were to proceed. Likewise, any potential expansion of the Cultus service will require similar analysis by BC Transit and community support. Any additional analysis relating to the FVRD will have to align with BC Transit's existing work plan and their ability to undertake additional planning projects.

Initial planning work (scoping) has been undertaken on the North of the Fraser initiative and the potential expansion generated interest during the Transit Future Action Plan (TFAP) process. Completion of the TFAP and further planning work on this initiative has been delayed due to the COVID-19 emergency.

Expansion of the Cultus Lake service will only be considered subject to community and local government interest and support. At this point there is a more pressing need to reassess the existing service to ensure it is meeting the community's current needs and expectations.

COST

Under BC Transit's funding formula, the province funds 46.69% of conventional transit systems and local governments 53.31%. Revenues collected from the transit systems are used to reduce the local property tax share of the costs.

According to BC Transit, "The estimated costing remains unchanged from the Expansion Memorandum of Understanding (MOU) previously approved by your local government, and we anticipate that these estimates will be subject to further inflationary increases."

Through the federal-provincial *Safe Restart* Agreement, BC Transit will be receiving \$86 million "... to support municipal partners who receive fare revenue as part of the provincial-municipal partnership to deliver BC Transit services throughout the province." The release of further details on when and how the funding will be allocated has been limited by the provincial election, however based on public information indications are that revenue losses and other costs will be covered for the 2020-21 and 2021-22 fiscal years. This will help maintain the healthy FVX surplus which, per the FVRD's 2020 5-year financial plan, will be used to reduce the tax impact as the expansion is implemented. At year-end 2019, the appropriated surplus balance for the FVX service sat at \$756,650.

More details with respect to the *Safe Restart* funding will be provided by BC Transit in the coming weeks. It is likely that ridership levels may take some time to recover as the economy slowly reopens, and public confidence in transit services rebuilds. Safety measures that have already been implemented will remain in effect until such time the COVID-19 emergency ends.

CONCLUSION

BC Transit is in the process of reinitiating some of the initiatives that were put on hold, including expansion planning. The purpose of the updated TIPs letter is to re-confirm the desire to proceed with the deferred expansion initiative in 2021/22, as well as identify expansion priorities in future years. These initiatives, of most note the FVX expansion to Lougheed Centre Skytrain station, was previously approved by the Board and incorporated into the 2020 5-year financial plan in 2019.

Given very tight time-lines (letter received November 20, 2020), this recommitment must be provided to BC Transit "as soon as possible" to be included in the province's February 2021 budget.

COMMENTS BY:

Stacey Barker, Director of Regional Services: Reviewed and supported.

Kelly Lownsbrough, Chief Financial Officer/ Director of Finance: Reviewed and supported. BC Transit has committed to providing further information on Safe Restart funding in the coming weeks. It is anticipated that the funding will alleviate pressures experienced due to the global pandemic.

Jennifer Kinneman, Chief Administrative Officer: Reviewed and supported.

Attn: Alison Stewart Manager of Strategic Planning Fraser Valley Regional District

Re: 3 Year Transit Expansion Initiatives

Dear Alison,

As we continue to respond to the impact of COVID-19 and focus our efforts on recovery, the health and safety of our operators and customers remains paramount. As restrictions begin to lift across the province and customers are returning to their normal travel routines, there is also work underway to reinitiate many of our key processes in collaboration with local governments. As much as the future remains uncertain, we must also begin to plan appropriately for the future growth of our transit systems.

Each year, BC Transit confirms service expansion plans for the coming year with local government partners, and also confirms service expansion priorities for the subsequent two years. This process ensures that 3-year expansion initiatives are consistent with the expectations of local governments, and allows BC Transit to proceed with securing the funding and resources to implement service expansions.

In late April, we communicated the decision to defer all planned 2020/21 expansion initiatives until 2021/22 in order to focus our efforts on service and ridership recovery across the province. As our society and the economy have begun to open back up, we have made every effort to ensure that transit service could accommodate increased travel while maintaining the safety of employees and customers. At the same time, we have begun to reinitiate some of the initiatives that were put on hold, including our expansion planning. The purpose of this letter is to re-confirm the desire to proceed with the deferred expansion initiative(s) in 2021/22, as well as identify your expansion priorities for both 2022/23 and 2023/24.

We ask that a signed copy of this letter be returned to BC Transit as soon as possible. Please contact me at your earliest convenience to discuss further if required. Following confirmation of the provincial budget in February, we will confirm with you that supporting provincial funding has been secured and initiate a transit service implementation plan. I look forward to working with you on the continued improvement of your transit service and encourage you to contact me if you have any questions regarding these proposed initiatives.

Yours truly,

Rob Ringma Senior Manager, Government Relations BC Transit

Three-Year Transit Expansion Plan

Proposed Transit Service Expansion Initiatives

The table below outlines expansion initiatives previously identified for implementation in 2020/21, which are now deferred to 2021/22. The estimated costing remains unchanged from the Expansion Memorandum of Understanding (MOU) previously approved by your local government, and we anticipate that these estimates will be subject to further inflationary increases. Please ensure that these initiatives are consistent with your local government expectations.

PROPOSED EXPANSION INITIATIVES (Year 1 2021/2022)							
AOA Period	In Service Date	Annual Hours	Vehicle Requirements	Estimated Annual Revenue	Estimated Annual Total Costs	Estimated Annual Net Municipal Share	
		6,000	4	\$141,696	\$1,061,843	\$494,436	
2021/22	Jan-22	Description	Expanding FVX se	rvice to Lougheed	Skytrain Centre		

The table below outlines expansion initiatives for year two and three of the three-year transit service expansion initiatives. Please note that we are unable to provide estimated costing for these initiatives as part of this year's revised process, but that cost estimates will be provided as part of next year's annual process for all three years. In the meantime, please ensure that these initiatives are consistent with the expectations of your local government.

PROPOSED CONVENTIONAL EXPANSION INITIATIVES – YEARS 2 & 3 (2022/23 and 2023/24)						
AOA Period	In Service Date	Annual Hours	Vehicle Requirements	Estimated Annual Revenue	Estimated Annual Total Costs	Estimated Annual Net Municipal Share
		2,500	2	\$11,475	\$353,273	\$212,937
2022/23Sep-22Subject to feasibility study ex to include: Agassiz-Mission N			-	the Fraser Valley		
		1,500	0	\$22,140	\$152,518	\$59,167
2022/23	Jan-23	Description	Extend year roun	d service to Cultus	Lake.	

Approval

On behalf of the Fraser Valley Regional District, I/we are confirming to BC Transit our interest in proceeding with the deferred expansion initiative in 2021/22. Furthermore, I/we confirm that the expansion priorities identified for 2022/23 and 2023/34 align with our expectations, and that we will review and confirm these initiatives on an annual basis and with the knowledge that associated cost estimates will be once again be provided as part of this process in future years.
